1. Introduction

The purpose of the Minor Works Review of Environmental Factors (MWREF) is to outline the proposed works, document its potential environmental impacts, detail the mitigation measures to be implemented, and determine whether the proposed works can proceed. For this work, Murrumbidgee Irrigation (MI) acts as the proponent and determining authority under Division 5.1 of the Environmental Planning and Assessment Act 1979 (EP&A Act) and under Schedule 1 of the *NSW Water Management Act 2000* (WM Act).

The description of the proposed works and the assessment of associated environmental impacts are conducted in accordance with section 171 of the Environmental Planning and Assessment Regulation 2021, the Guidelines for Division 5.1 Assessments (DPE, 2022), the Biodiversity Conservation Act 2016 (BC Act), the National Parks and Wildlife Act 1974 (NPW Act) and the Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth) (EPBC Act).

The MWREF helps fulfill the requirements of section 5.5 of the EP&A Act, ensuring that the proponent examines and considers all matters affecting or likely to affect the environment due to the activity.

The findings of the MWREF are considered when assessing:

- Whether the proposal is likely to have a significant impact on the environment, necessitating the preparation of an environmental impact statement and seeking approval from the Minister for Planning and Public Spaces under Division 5.2 of the EP&A Act.
- The significance of any impact on threatened species as defined by the BC Act, in section 1.7 of the EP&A Act, and the requirement for a Species Impact Statement or a Biodiversity Development Assessment Report.
- The potential for the proposal to significantly impact a matter of national environmental significance, including nationally listed threatened biodiversity matters or the environment of Commonwealth land. If a significant impact is likely on nationally listed biodiversity matters, the proposal must either be reconsidered, or a project Review of Environmental Factors (REF) must be prepared.

2. The proposed works

2.1. Description

Murrumbidgee Irrigation (MI) is proposing \$62 million of piping and rationalisation of urban channels, funded as eligible activities under the Resilient Rivers Water Infrastructure Program (RRWIP). The Program is an \$494 million initiative aimed at improving water delivery infrastructure and recovering up to 450 gigalitres (GL) of water annually for environmental purposes within the Murray-Darling Basin (DCCEEW, 2025).

The proposed works involve replacing approximately 50 kilometres (km) of aging concrete and earthen urban supply channels in and adjacent to existing channels, as well as 1.4km of leaking pipeline, with new pipelines. The proposed works also involves rationalisation of 33 escapes, removing and replacing approximately 500 customer outlets, 2 new pump stations, road and rail crossings and a reconfiguration of the network creating greater water delivery efficiency.

2.1.1. Proposed works location

The proposed works would be delivered in urban areas within the Griffith and Leeton Local Government Areas (LGAs). The scheduled channels intersect land owned and managed by a variety of stakeholders including MI, Griffith City Council (GCC), Leeton Shire Council (LSC), New South Wales (NSW) Crown Lands, Transport for NSW (TfNSW) and private landholders.

The proposed works would be divided into thirteen smaller discrete work locations across the two LGAs, determined by their location and sizes. These have been designated Environmental Areas (EAs), and are as follows:

- Griffith Lateral 92 – EA1
- Griffith Laterals Other – EA2
- Griffith West – EA3
- Griffith Lake Wyangan – EA4
- Griffith Beelbanger – EA5
- Griffith Bilbul – EA6
- Griffith Yenda – EA7
- Griffith Lateral 253 – EA8
- Leeton Lateral 63 – EA9
- Leeton Laterals 5, 99 & 21 – EA10
- Leeton Laterals Other – EA11
- Leeton Corbie Hill Laterals 7, 22, 23, 24 – EA12
- Leeton Wamoon Lateral 73 – EA13

This MWREF focuses on the potential environmental impacts and proposed mitigation measures to be implemented relevant to **Leeton Corbie Hill Laterals 7, 22, 23 & 24 – EA12**.

It should be noted that EA8 will be progressed separately by MI due to a confirmation of scope.

The proposed works location for EA12 is shown in Figure 2-1 below.

Figure 2-1 Proposed works locality

2.1.2. Proposed works description

The following construction methodology is proposed:

1. Site establishment, including environmental and cultural heritage protection measures, site amenities, and laydown/stockpile areas, if required
2. Work Health and Safety (WH&S) and traffic control
3. Construction of pipelines using a range of construction methods, including but not limited to:
 - Under boring / horizontal directional drilling (HDD)
 - Trenching within the existing channel profile
 - Trenching to install pipeline next to the existing channel and backfilling the channel following completion
 - New pipelines would be installed at a maximum depth of 2000 millimetres (mm) below the natural surface level
4. Removal and replacement of outlets/customer connection points
5. Removal of redundant channel infrastructure
6. Removal of rationalised supply escape structures
7. Making good to a finished standard, which may include backfilling with topsoil and seeding in specific amenity areas.

For the proposed works across the thirteen areas, the construction approaches to be used include:

- New pipeline - to be constructed within the specified new alignment.
- Convert existing channels to new pipeline - new pipeline to be constructed beside the existing channel (up to 2000mm)
- Remove and/or decommission existing channel - remove concrete channel and backfill channel to natural ground level.
- Install new drainage channel - construct new channel at a single location - Yenda.
- Infrastructure may also be retained as-is
- Underboring would be utilised in sensitive areas where surface access is unavailable.

For all construction approaches, excavators of varying sizes will be used depending on the proposed works. High Density Poly Ethelene welding machines would be employed for different welding sizes. The pipes would be strung and welded and then lowered into the excavated trenches. Before laying the pipes at the bottom of the pit, bedding material would be placed.

Where outlets and other fittings are involved, they would be welded onto the pipes according to design specifications. All pipelines to be constructed would run across different roads and will be sleeved into existing MI culverts if the design permits. If the design does not allow the use of existing culvert infrastructure, new envelopers or other sleeving materials will be constructed. Refer to Appendix B for concept plans detailing the construction approaches.

For the purposes of this MWREF, a 10m buffer has been applied to either side of the existing channel/pipeline infrastructure to determine the work area and identify the worst-case scenario impacts. The final development impact areas are likely to be reduced in nature.

The planned works for EA12 include 2.69km of UCP modifications for new pipeline, 290m of channel to be retained as-is, and 1.7km of channel to be decommissioned.

Minor Works Review of Environmental Factors

Murrumbidgee Irrigation UCP – Environmental Planning Area 12 – Leeton Corbie Hill Laterals 7, 22, 23, 24

Please refer to Figure 2-2 below for the extent of area assessed for EA12.

Figure 2-2 Proposed works

2.1.3. Proposed works objectives

The proposed works objectives and anticipated benefits are as follows:

- Significantly increasing customer service levels and system capacity
- Increasing regional productivity through water use efficiency
- Providing further security of water supply to towns and industry
- Investing in regional communities through local contractors
- Enhancing socio-economic outcomes by supplying water for urban green spaces, as well as providing the opportunity for local councils to deliver improved infrastructure
- A reduction in mosquito borne diseases
- Enhanced road safety.

The proposed works objectives align with the RRWIP objectives of:

- Provide water recovery for the Murray Darling Basin through improved water use
- Investment in infrastructure that provides:
 - longer-term outcomes
 - multiple benefits
 - water recovery for the environment
- Underpin long-term, climate change resilient primary production (DCCEEW, 2025).

2.1.4. Ancillary features

Table 2-1 Ancillary facilities

Ancillary facilities		
Will the proposal require the use or installation of a compound site? The 10m buffer either side of the proposed new pipeline has been assessed to be utilised for potential laydown/compound areas for construction plant parking, stockpiling construction materials, and temporary amenities. Additionally, EA12 could utilise the following areas, if required: • North off Corbie Hill Road (inside proposed works loop) – 2.12ha • North off Corbie Hill Road (western side inside proposed works loop) – 3.05ha It should be noted that the total area of the compound/laydown may not be required to be utilised. The compound/laydown area would be used for plant parking and storing construction machinery while not in use, stockpiling construction materials and temporary amenities. An example of the laydown area similar to the one to be utilised for EA12 is shown in Figure 2-3 and Figure 2-4.	Yes ☒	No ☐
Will the proposal require the use or installation of a stockpile site? As above.	Yes ☒	No ☐
Are any other ancillary facilities required (e.g. temporary plants, parking areas, access tracks)? As above.	Yes ☒	No ☐

Figure 2-3 Example of one of the proposed compound/laydown areas (north off Corbie Hill Road facing east)

Figure 2-4 Example of one of the proposed compound/laydown areas (south off Corbie Hill Road facing west)

2.1.5. Proposed date of commencement

Proposed works for EA12 are expected to commence construction in July/August 2025. The commencement date is indicative and may change.

2.1.6. Estimated length of construction period

The proposed works would be expected to take approximately 6 – 12 weeks, weather permitting. Works would be carried out during the following work hours and taking place in certain areas outside of working hours:

- **Monday to Friday:** 7:00am to 6:00pm
- **Saturday:** 7:00am to 6:00pm
- **Sunday:** 7:00am to 6:00pm
- **Public Holidays:** 7:00am to 6:00pm

The construction taking place outside of working hours is considered beneficial to the overall project as it will reduce impact and delays to the local public transport services (e.g. school buses) during the week.

It should be noted that a diesel pump may be required to operate outside the standard working hours (worst-case over a 24hr period), to dewater the existing channels or supply water. The potential impacts have been discussed in Section 3.6 below.

2.2. Needs and options

2.2.1. Options / alternatives considered

The scale and scoping restriction of the proposed works meant there are limited feasible choices of location and construction approaches. It should be noted that the choice of undertaking the works either within or adjacent to the existing channel, and the selection of compound/laydown areas were based off desktop assessment and where applicable biodiversity and Aboriginal heritage site surveys within the proposed works locations.

Options considered

The options considered for the proposed works included:

Option 1 – ‘Do nothing’ option

This option involves leaving the existing channels/pipelines as it, which would result in the status quo of water supply efficiency. This option would not enable any works to occur, and while no immediate or visible impact to the environment would occur as a result, this would not align with the objectives of MI and the RRWIP Program improving water delivery infrastructure within the Griffith and Leeton LGAs.

Option 2 – Undertaking the proposed works

This option involves undertaking the proposed works as described in this section. As detailed in Section 3 below, the proposed works have avoided impacts to key environmental constraints. Where impacts could not be avoided, appropriate safeguards and mitigation measures have been recommended to minimise any potential impacts.

Preferred option

The preferred option is:

Option 2 – Undertaking the proposed works. This option suits the objectives of the proposed works without leading to significant impacts to environmental factors while supplying irrigation water to customers in a more efficient manner

2.2.2. Justification for the proposed works

The proposed works is required to significantly enhance customer service and system capacity through precise water control and delivery, therefore boosting regional productivity via efficient water use.

It would ensure water supply security for stakeholders by enabling connections to a raw water pipeline. The proposed works invests heavily in regional communities.

Minor Works Review of Environmental Factors

Murrumbidgee Irrigation UCP – Environmental Planning Area 12 – Leeton Corbie Hill Laterals 7, 22, 23, 24

Socio-economic outcomes would be improved by supplying water for urban green spaces and enabling Leeton Shire Council (LSC) to enhance infrastructure like pedestrian paths. Additionally, it reduces mosquito-borne diseases by eliminating open water sources, enhances road safety through better drainage, and decreases road maintenance needs.

While the proposed works has the potential to impact on the environment, these impacts have been avoided or minimised where possible. Mitigation measures would be implemented to minimise and manage any remaining potential environmental impacts.

2.3. Statutory and planning framework

NSW Water Management Act 2000 (WM Act)

The WM Act governs the sustainable and integrated management of NSW's water resources. The main objects of the Act are to provide the sustainable and equitable use of water resources through water management principles, water sharing plans, access licences, environmental water protection, and compliance (NSW Government, 2000).

Under Chapter 4 Part 1, MI is an irrigation corporation by way of inclusion in Schedule 1 of the Act. Under section 122 of the WM Act, the operating licence for an irrigation corporation authorises the corporation to carry on the business of supplying water provided to it by the Water Administration Ministerial Corporation (the Ministerial Corporation) and to exercise its functions under this Part.

MI would exercise its powers on behalf of the Ministerial Corporation in accordance with its operating licence, and as such, would act as both proponent and determining authority for the MWREF.

Environmental Planning and Assessment Act 1979 (EP&A Act)

Under section 5.5 of the EP&A Act, a public authority is compelled to assess and consider the impact of an activity (NSW Government, 1979). Section 5.5 states:

Duty to consider environmental impact (cf previous s 111)

For the purpose of attaining the objects of this Act relating to the protection and enhancement of the environment, a determining authority in its consideration of an activity shall, notwithstanding any other provisions of this Act or the provisions of any other Act or of any instrument made under this or any other Act, examine and take into account to the fullest extent possible all matters affecting or likely to affect the environment by reason of that activity.

As such MI is compelled to prepare an environmental assessment for the proposal and consider the same before proceeding with the activity.

The environmental assessment would be completed in the form of a Minor Works Review of Environmental Factors (MWREF). The MWREF will be completed in accordance with Division 5.1 of the EP&A Act, taking into account the requirements of Section 171(2) of the EP&A Reg (previously Clause 228 Factors of the EP&A Regulation 2000).

The MWREF will describe the approval requirements for the proposal, detail MI's delegation to be the "Determining Authority" and address the requirements of other relevant New South Wales and Commonwealth legislation including the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act).

State Environmental Planning Policy (Transport and Infrastructure) 2021

The State Environmental Planning Policy (Transport and Infrastructure) 2021 (TISEPP) aims to facilitate the effective delivery of infrastructure across the state. This includes roads and road infrastructure facilities, and port, wharf or boating facilities.

Minor Works Review of Environmental Factors

Murrumbidgee Irrigation UCP – Environmental Planning Area 12 – Leeton Corbie Hill Laterals 7, 22, 23, 24

The TISEPP provides a streamlined framework for developments in NSW (NSW Government, 2021). The TISEPP takes precedence over the Local Environmental Plan (LEP) when there is conflicting permissibility for development within the same zoning. If a development is not permissible under the LEP, but is under the TISEPP within the same zoning, the provisions of the TISEPP prevail. Division 24 of the TISEPP relates to water supply infrastructure.

EA1 is not identified as “coastal wetlands” or “littoral rainforest” on the Coastal Wetlands and Littoral Rainforests Area Map and therefore the provisions of section 2.159A of the TISEPP do not apply.

Under section 2.159(1), development for the purpose of water reticulation systems may be carried out by or on behalf of a public authority without consent on any land. MI would exercise its powers on behalf of the Ministerial Corporation in accordance with its operating licence.

It is also noted under section 2.161; water reticulation systems may be carried out by any person with development consent on any land.

Leeton Local Environmental Plan 2014

Permissibility under the LEP in NSW outlines the legislation that determines what types of developments are permitted within particular zones within an LGA. The key aspects are:

- Zoning
- Permissible development
- Without consent
- With consent
- Prohibited development
- Development standards
- Assessment criteria.

EA12 falls on land zoned RU1 Primary Production, R2 Low Density Residential and R5 Village under the provisions of the Leeton Local Environmental Plan 2014 (Leeton LEP) (NSW Government, 2014)

The proposed works has been defined as a water reticulation system. Under the Leeton LEP, water reticulation systems are permitted without consent within all land zoning identified above.

2.3.1. Other relevant legislation and environmental planning instruments

Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth)

The Commonwealth *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) regulates the assessment and approval of activities that would have or are likely to have a significant impact on Matters of National Environmental Significance (MNES), activities by Commonwealth government agencies and activities by any person on Commonwealth land.

Currently MNES include:

- World Heritage properties
- National Heritage places
- Wetlands of international importance (listed under the Ramsar Convention)

Minor Works Review of Environmental Factors

Murrumbidgee Irrigation UCP – Environmental Planning Area 12 – Leeton Corbie Hill Laterals 7, 22, 23, 24

- Nationally listed threatened species and ecological communities
- Migratory species (protected under international agreements)
- Commonwealth marine areas
- Great Barrier Reef Marine Park
- Nuclear actions (including uranium mines)
- A water resource, in relation to coal seam gas development and large coal mining development.

An EPBC Act protected matters search was undertaken on March 5, 2025. An assessment of the impacts of the proposal determined that the proposal does not constitute an activity which may have a significant adverse impact on any MNES (Appendix C). MNES relevant to the study area include:

- Nationally listed threatened species and ecological communities
- Migratory species (protected under international agreements)
- Commonwealth Marine Area

A referral is not required for proposed activities that may affect nationally listed threatened species, endangered ecological communities and migratory species. This is because requirements for considering impacts to these biodiversity matters are the subject of a strategic assessment approval granted under the EPBC Act by the Australian Government in September 2015.

Potential impacts to these biodiversity matters are also considered as part of Section 3.1 of this MWREF and Appendix C.

Native Title Act 1993 (Commonwealth)

The *Native Title Act 1993* provides a legislative framework for the recognition and protection of common law native title rights. Native title is the recognition by Australian law that Indigenous people had a system of law and ownership of their lands before European settlement. Where that traditional connection to land and waters has been maintained and where government acts have not removed it, the law recognises the persistence of native title.

A search of the National Native Title Tribunal Registers on 18 June 2025 found no native title holders for the proposal site within the Leeton Local Government Area.

Environmental Planning and Assessment Regulation 2021 (EP&A Regulation)

The EP&A Regulation sets out the requirements and form for an REF and the consideration of matters to be addressed.

Section 170 refers to the REF Guidelines to be followed.

Section 171(2) refers to the environmental factors to be taken into account in an REF.

Section 171(4) requires publication of an REF for any activity with:

- A capital investment value of more than \$5 million
- An approval or permit for activity that requires approval under:
 - *Fisheries Management Act 1994* (NSW) sections 144, 201, 205 or 219
 - *Heritage Act 1977* (NSW) section 57

Minor Works Review of Environmental Factors

Murrumbidgee Irrigation UCP – Environmental Planning Area 12 – Leeton Corbie Hill Laterals 7, 22, 23, 24

- *National Parks and Wildlife Act 1974* (NSW) section 90
- *Protection of the Environment Operations Act 1997* (NSW) sections 47-49 or 122
- If the determining authority considers it to be in the public interest.

This applies to the proposal unless, as noted under section 171(6), it:

- a) Belongs to a class specified by the Planning Secretary in a notice published on the Department's website for the purposes of this section, or
- b) An approved code under Division 6 applies.

Publishing of the REF must be undertaken either:

- a) Before the activity commences, or
- b) As soon as practicable, no later than one month after the activity commences.

The proposed works is likely to have a capital investment value greater than \$5 million, therefore the MWREF would require publication as per Section 171(4) of the Regulation.

Publication of the MWREF would be on the MI webpage.

National Parks and Wildlife Act 1974 (NSW)

The objectives of the NPW Act are to conserve and preserve nature; conserve objects, places, or features (including biological diversity) of cultural value within the landscape; foster public appreciation, understanding and enjoyment of nature and cultural heritage and their conservation; and provide for the management of land reserved under this Act.

Section 3.2 assesses the potential for the proposal to impact on Aboriginal heritage.

Biodiversity Conservation Act 2016 (NSW)

The purpose of the NSW BC Act is to maintain a healthy, productive, and resilient environment for the greatest well-being of the community, now and into the future, consistent with the principles of ecologically sustainable development.

Section 1.7 of the EP&A Act requires consideration of the significance of any impact on threatened species, defined by section 7.3 of the BC Act, in order to determine the requirement for a Species Impact Statement or a Biodiversity Development Assessment Report.

An assessment of the potential impacts of the proposed activity on threatened species, populations, ecological communities and critical habitat listed in the BC Act must be undertaken. This includes an assessment of the potential for a significant impact under section 7.3 (5 part test) and whether an impact is likely on an area of Outstanding Biodiversity Value.

A Biodiversity Assessment was conducted including a search of the Office of the Environment and Heritage (OEH) BioNet database which was undertaken on March 5, 2025 (refer to Appendix C). The potential for the proposal to impact threatened species, populations and endangered ecological communities is assessed in Section 3.1. Tests of Significance are provided in G.1.

Heritage Act 1977 (NSW)

The *Heritage Act 1977* (NSW) (Heritage Act) is a statutory tool developed to conserve the cultural heritage of NSW. It is used to regulate development impacts on the State's heritage assets. Administered by the NSW Heritage Office, the Act details the statutory requirements for protecting historic buildings and places and includes *any place, building, work, relic, movable object or precinct, which may be of historic, scientific, cultural, social, archaeological, natural or aesthetic value*.

Under the Heritage Act, a person must not disturb or excavate land if they know or have reasonable cause to suspect that they might discover, expose, move or damage a relic unless they have an excavation permit.

Items considered to be significant to the State can be listed on the State Heritage Register (SHR) and cannot be demolished, altered, moved or damaged, or their significance altered, without approval from the Heritage Council of NSW. Other items may be listed on the National and Commonwealth Heritage Lists, State Heritage Inventory (SHI) or by local Councils in LEPs. Additionally, under Section 170 of the Heritage Act, all government agencies are required to identify, conserve and manage heritage items in their ownership or control. Items are typically listed in a Heritage and Conservation Register and may also be included on the SHI.

There are no items of non-Aboriginal heritage within or adjacent to the proposal area.

Section 3.3 addresses potential impacts associated with non-Aboriginal heritage items and places.

Contaminated Land Management Act 1997 (NSW)

The objectives of the *Contaminated Land Management Act 1997* (NSW) (CLM Act) are:

- To set out accountabilities for managing contamination if the EPA considers the contamination is significant enough to require regulation under Division 2 of Part 3
- To set out the role of the Environmental Protection Authority (EPA) in the assessment of contamination and the supervision of the investigation and management of contaminated sites
- To provide for the accreditation of site auditors of contaminated land to ensure appropriate standards of auditing in the management of contaminated land
- to ensure that contaminated land is managed with regard to the principles of ecologically sustainable development.

Section 3.11 discusses potential impacts associated with contamination.

Biosecurity Act 2015 (NSW)

The primary objective of the *Biosecurity Act 2015* (NSW) is to provide a framework for the prevention, elimination and minimisation of biosecurity risks posed by biosecurity matter, dealing with biosecurity matter, carriers and potential carriers, and other activities that involve biosecurity matter, carriers or potential carriers. The biosecurity framework and tools safeguard our economy, environment and community and any land managers and users of land have a responsibility for managing weed biosecurity risks that they know about or could reasonably be expected to know about.

The *Biosecurity Act 2015* repealed the *Noxious Weeds Act 1993* and provides a framework for the prevention, elimination and minimisation of biosecurity risks. The Act and supporting Biosecurity Regulation

Minor Works Review of Environmental Factors

Murrumbidgee Irrigation UCP – Environmental Planning Area 12 – Leeton Corbie Hill Laterals 7, 22, 23, 24

2017 provide for the establishment and functions of Local Control Authorities for weeds (LGA or County Councils) and weed control obligations on public and private land.

A search of the Department of Primary Industries WeedWise database for regional priority weeds for the Leeton town was undertaken on 18 June 2025 (Appendix C).

Section 3.1 addresses impacts relating to priority weeds.

Protection of the Environment Operations Act 1997 (NSW)

The *Protection of the Environment Operations Act 1997* (NSW) (POEO Act) is the primary legislation regulating pollution control and waste disposal in NSW. It establishes a structure for regulating polluting activities through Environment Protection Licences (EPLs). Activities listed under Schedule 1 of the POEO Act are scheduled activities which require an EPL.

Section 120 of this Act provides that it an offence to pollute waters. The relevant consent authority, in this case, MI, must ensure that all stages of proposals are managed to prevent pollution, including pollution of waters.

Section 148 of this Act requires notification of pollution incidents. MI are obliged to notify the relevant authorities (e.g., EPA) when a 'pollution incident' occurs that causes or threatens 'material harm' to the environment.

Schedule 1 of the POEO Act describes activities for which an EPL is required. The proposed works do not conform with the definition of a scheduled activity under this Act; therefore, a new EPL would not be required.

Roads Act 1993 (NSW)

The objectives of the *Roads Act 1993* (NSW) (Roads Act) are to:

- Set out the rights of members of the public to pass along public roads
- Set out the rights of persons who own land adjoining a public road to have access to the public road
- Establish the procedures for the opening and closing of a public road
- Provide for the classification of roads
- Provide for the declaration of TfNSW and other public authorities as roads authorities for both classified and unclassified roads
- Confer certain functions (in particular, the function of carrying out road work) on TfNSW and on other roads authorities
- Provide for the distribution of the functions conferred by this Act between TfNSW and other roads authorities
- Regulate the carrying out of various activities on public roads.

Under Section 138 of the Roads Act, a person must not erect a structure or carry out a work in, on or over a public road, or dig up or disturb the surface of a public road, otherwise than with the consent of the appropriate road's authority.

The proposal would only affect local roads managed by Council. A such, consultation with LSC would be undertaken as part of this MWREF process.

2.4. Community engagement and agency consultation

2.4.1. SEPP (Transport and Infrastructure) consultation

Table 2-2 Consultation required with Council

Is consultation with Council required under sections 2.10 - 2.12 and 2.14 of the SEPP (Transport and Infrastructure)?		
Are the works likely to have a substantial impact on the stormwater management services which are provided by council?	Yes ☐	No ☒
Are the works likely to generate traffic to an extent that will strain the capacity of the existing road system in a local government area?	Yes ☐	No ☒
Will the works involve connection to a council owned sewerage system? If so, will this connection have a substantial impact on the capacity of the system?	Yes ☐	No ☒
Will the works involve connection to a council owned water supply system? If so, will this require the use of a substantial volume of water?	Yes ☐	No ☒
Will the works involve the installation of a temporary structure on, or the enclosing of, a public place which is under local council management or control? If so, will this cause more than a minor or inconsequential disruption to pedestrian or vehicular flow?	Yes ☐	No ☒
Will the works involve more than a minor or inconsequential excavation of a road or adjacent footpath for which council is the roads authority and responsible for maintenance? Consultation with LSC has been summarised in Section 2.4.2 below and appended as Appendix F.	Yes ☒	No ☐
Is there a local heritage item (that is not also a state heritage item) or a heritage conservation area in the study area for the works? If yes, does a heritage assessment indicate that the potential impacts to the heritage significance of the item/area are more than minor or inconsequential?	Yes ☐	No ☒
Is the proposal within the coastal vulnerability area and inconsistent with a certified coastal management program applying to that land?	Yes ☐	No ☒
Are the works located on flood liable land? If so, will the works change flooding patterns to more than a minor extent?	Yes ☐	No ☒

Minor Works Review of Environmental Factors

Murrumbidgee Irrigation UCP – Environmental Planning Area 12 – Leeton Corbie Hill Laterals 7, 22, 23, 24

Table 2-3 Consultation required with other public authorities

Is consultation with a public authority (other than Council) required under sections 2.13, 2.15 and 2.16 of the SEPP (Transport and Infrastructure)?		
Are the works located on flood liable land? (to any extent) If so, do the works comprise more than minor alterations or additions to, or the demolition of, a building, emergency works or routine maintenance?	Yes ☐	No ☒
Are the works adjacent to a national park, nature reserve or other area reserved under the <i>National Parks and Wildlife Act 1974</i> , or on land acquired under that Act?	Yes ☐	No ☒
Are the works on land in Zone C1 National Parks and Nature Reserves or in a land use zone equivalent to that zone?	Yes ☐	No ☒
Do the works include a fixed or floating structure in or over navigable waters?	Yes ☐	No ☒
Are the works for the purpose of residential development, an educational establishment, a health services facility, a correctional facility or group home in bush fire prone land?	Yes ☐	No ☒
Would the works increase the amount of artificial light in the night sky and that is on land within the dark sky region as identified on the dark sky region map? (Note: the dark sky region is within 200 kilometres of the Siding Spring Observatory)	Yes ☐	No ☒
Are the works on buffer land around the defence communications facility near Morundah? (Note: refer to Defence Communications Facility Buffer Map referred to in clause 5.15 of Lockhart LEP 2012, Narrandera LEP 2013 and Urana LEP 2011).	Yes ☐	No ☒
Are the works on land in a mine subsidence district within the meaning of the <i>Mine Subsidence Compensation Act 1961</i> ?	Yes ☐	No ☒
Are the works on, or reasonably likely to have an impact on, a part of the Willandra Lakes Region World Heritage Property?	Yes ☐	No ☒
Are the works within a Western City operational area specified in Schedule 2 of the <i>Western Parkland City Authority Act 2018</i> with a capital value of \$30 million or more?	Yes ☐	No ☒

Minor Works Review of Environmental Factors

Murrumbidgee Irrigation UCP – Environmental Planning Area 12 – Leeton Corbie Hill Laterals 7, 22, 23, 24

Table 2-4 Notification of council and occupiers of adjoining land

Do Council and occupiers of adjoining land need to be notified under section 2.111 of the SEPP (Transport and Infrastructure)?		
Does the proposal include a car park intended for the use by commuters using regular bus services?	Yes ☐	No ☒
Does the proposal include a bus depot?	Yes ☐	No ☒
Does the proposal include a permanent road maintenance depot or associated infrastructure, such as garages, sheds, tool houses, storage yards, training facilities and workers amenities?	Yes ☐	No ☒

2.4.2. Other agency and community engagement

Table 2-5 Consultation with Leeton Shire Council (LSC) assessing potential impacts due to proposed works

TI SEPP Consultation Requirements	Impacts	Consultation Details	Consultation Responses/Outcomes
Leeton Shire Council (LSC)	Development with impacts on council-related infrastructure or services	Murrumbidgee Irrigation Project Managers and Communications team discussed the UCP Project on multiple occasions with Leeton Shire Council (LSC) Officers between March and June 2025. Specifically, a meeting was held on 13 June 2025 and presented the UCP impacts on Leeton Shire Council managed land. Items discussed included: Outlining key environmental concerns in letter provided to MI at the meeting which including biodiversity dependent on the	- MI noted environmental concerns that are covered in the REF process, which would be approved by MI under the TI SEPP approval pathway. - LSC and MI noted that some groups may not be supportive of removing the channels that support biodiversity, however no concerns have been received to date. - MI agreed to review the difference between flood prone land versus flood liable land and report back to LSC. - MI agreed to provide the results of silt testing at each environmental area to LSC

Minor Works Review of Environmental Factors

Murrumbidgee Irrigation UCP – Environmental Planning Area 12 – Leeton Corbie Hill Laterals 7, 22, 23, 24

TI SEPP Consultation Requirements	Impacts	Consultation Details	Consultation Responses/Outcomes
		irrigation channels. • Flood prone land • Silt management, placement, contamination and odour. • Channel banks, flood mitigation and finished levels • Post construction remediation • Official structures across pipelines • Use of channel water for emergency responses • Exposed LSC asset remaining exposed above ground, requiring bollard or similar protection once the pipeline installed. A formal letter was also provided to LSC, refer Appendix F.	and if not contaminated will allow MI to leave silt on LSC land. LSC would like to see the list of analytes before testing. Also indicated that the channels would be dewatered to reduce decaying organic matter and the odour. • MI proposed the finish pipeline level would be 100+mm than the highest point in road, to provide flood protection and discussed liability of impacts. • MI and LSC will work together to confirm final surface levels near roads. • MI indicated that remediation would be undertaken according to standards and guidelines such as fence reinstatement • As per the LSC guidelines - MI agreed fill used in Leeton from Roaches would not require VENM/ENM testing and a level 3 arborist clearance certificate was required for contractors impacting trees. • UCP Design plans would be submitted to Council.

Consultation with LSC by MI was undertaken to further assess and inform potential associated risks and impacts to council managed reserve as a result of proposed construction works at EA12.

Minor Works Review of Environmental Factors

Murrumbidgee Irrigation UCP – Environmental Planning Area 12 – Leeton Corbie Hill Laterals 7, 22, 23, 24

At this stage, consultation with private stakeholders was not required as the proposed works are located within MI or LSC managed land. Consultation and notification in relation to traffic and noise would be undertaken prior to commencement of works.

3. Environmental assessment

This Section provides a detailed description of the potential environmental impacts associated with the proposed works. All aspects of the environment potentially impacted upon by the proposed works are considered. This includes consideration of the factors specified in s171 of the Environmental Planning and Assessment Regulation 2021.

The matters of national environmental significance under the *Environment Protection and Biodiversity Conservation Act 1999* (Commonwealth) are also considered in Section 3.1 below. Site-specific safeguards and mitigation measures are provided to ameliorate the identified potential impacts.

3.1. Biodiversity

Table 3-1 Biodiversity

Description of existing environmental and potential impacts						
Have relevant database searches been carried out? - BioNet threatened species records within the locality - Regional vegetation mapping and BioNet Vegetation Classification database - NSW Seed portal for Plant Community Type (PCT) mapping - BioNet Vegetation Classification database NSW WeedWise (DPI) website. - Commonwealth EPBC Act Protected Matters Search Tool (PMST) - NSW DPI Fisheries Spatial Data Portal. - Biodiversity Values Mapping showing areas of outstanding biodiversity value					Yes ☒	No ☐
Did the database searches identify any endangered ecological communities, threatened flora and/or threatened or protected fauna, or migratory species in or within the vicinity of the proposed works? Both Commonwealth and State listed matters must be considered.					Yes ☒	No ☐
Scientific and common name	Status *	Type of listing (BC Act or EPBC Act)	Distance from works	Potential impacts		
Southern Bell Frog (<i>Litoria raniformis</i>)	E under NSW BC Act V under Commonwealth EPBC Act	BC Act EPBC Act	Approx. 7 km south at Murrumbidgee River	Southern Bell Frog could potentially use the channel for habitat, and adjacent areas to the channel, as foraging habitat. The impacts to this species without avoidance of works to the existing channel would potentially		

Description of existing environmental and potential impacts

				increase the impact. If the new pipeline is constructed adjacent to the existing channel, in conjunction with conducting these works outside of the <i>L. raniformis</i>' breeding period (September-April) the potential impact can be significantly reduced.		
Superb Parrot (<i>Polytelis swainsonii</i>)	V under NSW BC Act V under Commonwealth EPBC Act	BC Act EPBC Act	7115 records within 10 km of the proposed development	Superb Parrot could use areas of PCT 82 woodland for foraging habitat. No suitable breeding habitat (HBTs) are within, directly adjacent to the proposed development. The impacts to this species without avoidance of PCT 82 woodland would potentially increase the impact to this species. A TPZ is being established to avoid direct impacts to vegetation. Removal of some branches is the only potential direct impact to Superb Parrot habitat. Trimming branches will only occur, if necessary. With the implementation of a TPZ, the potential impact can be significantly reduced.		
Pink Cockatoo (<i>Lophochroa leadbeateri</i>)	V under NSW BC Act E under Commonwealth EPBC Act	BC Act EPBC Act	798 records within 10 km of the proposed development	Pink Cockatoo could use areas of PCT 82 woodland for foraging habitat. No suitable breeding habitat (HBTs) are within, directly adjacent to the proposed development. The impacts to this species without avoidance of PCT 82 woodland would potentially increase the impact to this species. A TPZ is being established to avoid direct impacts to vegetation. Removal of some branches is the only potential direct impact to Pink Cockatoo habitat. Trimming branches will only occur, if necessary. With the implementation of a TPZ, the		

Minor Works Review of Environmental Factors

Murrumbidgee Irrigation UCP – Environmental Planning Area 12 – Leeton Corbie Hill Laterals 7, 22, 23, 24

Description of existing environmental and potential impacts					
				potential impact can be significantly reduced.	
*V= vulnerable, E = endangered					
Does the proposal involve pruning, trimming or removal of any tree/s? It is possible pruning, trimming or removal of trees would be required for the installation of new pipelines.					Yes ☒ No ☐
Is the proposal likely to impact nationally listed threatened species, ecological communities or migratory species? Southern Bell Frog listed under EPBC Act					Yes ☒ No ☐
Would the proposal require the removal of any other vegetation? Discrete patches of exotic grassland within proposed works / laydown areas. The state vegetation mapping within the proposed works area is shown in Figure 3-1.					Yes ☒ No ☐
Would the proposal require the removal of any tree hollows?					Yes ☐ No ☒
Are there any known areas of outstanding biodiversity value or areas mapped as 'littoral rainforest' or 'coastal wetland' under chapter 2 of SEPP (Resilience and Hazards) in or within the vicinity of the proposed work?					Yes ☐ No ☒
Would the proposal provide any additional barriers to the movement of wildlife? Impacts would be minor and temporary. Dewatering of the existing channels would potentially impact the Southern Bell Frog by limiting or preventing movement across the channels following dewatering. An allowable time of two weeks following dewatering of existing earthen channels or 1-2 days for existing concrete channels would encourage the Southern Bell Frog offsite.					Yes ☒ No ☐
Would the proposal disturb any natural waterways or aquatic habitat? The existing channels could potentially use the channels for habitat, and adjacent areas to the channel, as foraging habitat. The impacts are considered to be minimal and discrete disturbances.					Yes ☒ No ☐
Would the proposal impact (directly or indirectly) any potential microbat roosting or breeding habitat such as on bridges and culverts?					Yes ☐ No ☒

3.1.1. Biodiversity detailed assessment

A Biodiversity Assessment (BA) (as summarised below) was undertaken for the proposed works at EA12. This BA included a search of all the relevant searches as detailed above, as well as a Test of Significance (ToS) and Assessment of Significance (AoS) for the Southern Bell Frog, Superb Parrot and Pink Cockatoo. These are attached as Appendix G.1 and Appendix G.2

Potential impacts

There are no hollow-bearing trees (HBTs), visible logs or fallen timber, rocky outcrops, or natural waterways that would provide valuable habitat to threatened species within the proposed works area. No direct impacts to any threatened species are expected, with the exception of threatened birds, such as Superb Parrot and Pink Cockatoo, that would use the areas adjacent to the irrigation channels for foraging habitat. However, as birds are more mobile than most species, these impacts are considered negligible.

During the biodiversity site survey, one HBT was identified (refer to Figure 3-1 below). This tree is being avoided and is not expected to have any direct or indirect impacts from the proposed works.

Within the southern section of the proposed works area, there is approximately 1.29ha of PCT 82 *Western Grey Box - Poplar Box - White Cypress Pine tall woodland*. PCT 82 is associated with Threatened Ecological Community (TEC's):

- BC Act listed *Inland Grey Box Woodland in the Riverina, NSW South Western Slopes, Cobar Penplain, Nandewar and Brigalow Belt South Bioregions*.
- EPBC Act listed *Grey Box (Eucalyptus microcarpa) Grassy Woodlands and Derived Native Grasslands of South-eastern Australia*.

As long as there is no removal of vegetation within these existing patches of PCT 82, further assessment will not be triggered. Additional safeguards and mitigation measures are detailed in Section 3.1.2.

Southern Bell Frog (*Litoria raniformis*) could potentially use the channel for habitat, and adjacent areas to the channel, as foraging habitat. There would potentially be impacts to the species if the proposed works are to be conducted within the existing channels, if required.

If the new pipeline is constructed within the existing channel, it is assumed that the channel will be drained prior to works commencing. The potential impacts to the species could be reduced by conducting these works outside of the *L. raniformis*' breeding period, as well as implementing the safeguards and mitigation measures relating to dewatering as detailed in Section 3.1.2 below.

The breeding period can be shorter if conditions are not ideal. As a water channel is not a permanent source of water, this would be considered not ideal habitat, and therefore the frogs use of the channel as breeding habitat would be dependent on if the channel held water for long enough within September-April to facilitate breeding.

A habitat evaluation table has been completed to assess the likelihood of occurrence (Appendix G.2). The tables in this appendix present the habitat evaluation for threatened species, ecological communities, and endangered populations listed for the locality in the NSW BioNet and those identified as potentially occurring in the area according to the Commonwealth EPBC Protected Matters Search Tool.

The likelihood of occurrence is based on presence of habitat, proximity of nearest records, and mobility of the species (where relevant). The assessment of potential impact is based on the nature of the proposal, the

ecology of the species, and its likelihood of occurrence. If a threatened entity is found to be potentially significantly impacted, a Test of Significance and Assessment of Significance is completed

Test of Significance

A Test of Significance (ToS) was complete for all threatened flora and fauna species and TEC listed under the NSW *BC Act* and found to have a potential likelihood of impact from the proposed development. The following were assessed:

- Southern Bell Frog (*Litoria raniformis*) – Endangered.
- Superb Parrot (*Polytelis swainsonii*) – Vulnerable.
- Pink Cockatoo (*Lophochroa leadbeateri*) – Vulnerable

The ToS found that the proposed development is not likely to have a significant impact on the Southern Bell Frog due to the lack of records within and near the proposed development and the limited habitat suitability that irrigation channels provide for the species. These areas would provide unsuitable breeding habitat due to the length of time that the irrigation channels hold water is not sufficient to allow growth of tadpoles to adulthood. The irrigation channels would provide limited foraging habitat due to the lack of aquatic vegetation and the dominance of exotic vegetation, agricultural disturbed land and residential areas surrounding the proposed works area.

For both Superb Parrot and Pink Cockatoo the ToS found that the proposed development is not likely to have a significant impact for either species due to the lack of suitable breeding habitat (HBTs) within the area of the proposed development, and minimal impact to woodland habitat used for foraging. Impacts to habitat for these species is restricted to trimming of branches (only if necessary), to a patch of PCT 82 *Western Grey Box - Poplar Box - White Cypress Pine tall woodland*.

Assessment of Significance

An Assessment of Significance (AoS) was complete for all threatened flora and fauna species and TEC listed under the commonwealth *EPBC Act* and found to have a potential likelihood of impact from the proposed development. The following were assessed:

- Southern Bell Frog (*Litoria raniformis*) – Vulnerable.
- Superb Parrot (*Polytelis swainsonii*) – Vulnerable.
- Pink Cockatoo (*Lophochroa leadbeateri*) – Endangered

The Southern Bell Frog would have impacts to approximately 7.13ha of potentially suitable habitat within the proposed development. Due to the following:

- the proposed works are not considered to contain critical habitat.
- the proposed works are not considered to have an important population
- there is a lack of records indicating a lower likelihood of occupation.
- the irrigation channels are shallow, and concrete based.
- the irrigation channels' vegetation is restricted to fringing terrestrial habitat which provides limited breeding habitat for the Southern Bell Frog.

The proposed work impacts to this species are not considered to be significant.

Minor Works Review of Environmental Factors

Murrumbidgee Irrigation UCP – Environmental Planning Area 12 – Leeton Corbie Hill Laterals 7, 22, 23, 24

Both Superb Parrot and Pink Cockatoo would have impacts to less than 0.18ha of suitable foraging habitat within the proposed development. Due to the following:

- the proposed works are not considered to contain critical habitat.
- the proposed works are not impacting breeding habitat.
- the proposed works are restricted to impacting less than 0.18ha of foraging habitat (only trimming branches at the periphery of woodland, only if necessary).
- the proposed works are not contributing to a decrease in the occupancy of both Superb Parrot and Pink Cockatoo.

The proposed work impacts to both Superb Parrot and Pink Cockatoo are not considered to be significant.

Figure 3-1 Plant Community Type (PCT) mapping for the proposed works at EA12

3.1.2. Safeguards and mitigation measures

To reduce impacts of the proposed works during construction, the following mitigation measures are recommended:

Vegetation

- Establishing a Tree Protection Zone (TPZ) around trees and patches of native vegetation that will be retained (areas of PCT 82) but are adjacent to construction works
- Strategic lopping of branches is allowed as long as no trees or shrubs are completely removed.
- All fallen timber and deadwood within the proposed works area should be retained or relocated to an adjacent area with the Proposal site.
- As much as is reasonable, proposed works should be contained to the existing channel footprint so as to reduce the direct impacts to areas of TPZs (areas of PCT 82).

Threatened species and migratory species

- Avoiding undergoing works (as far as practical) in Spring or Summer, which is when Southern Bell Frog are most active and the most likely to utilise the irrigation channels. As reasonable, undergo as much works in Autumn and Winter.
- If works are to be completed in Spring and Summer;
 - a. a fauna spotter catcher can be on site to confirm if Southern Bell Frog is present, only if a recent, significant rise in water has occurred (a significant flooding event). Or;
 - b. If rain events are not significant enough to create a rise in water that would retain water for at least a four-month period (a significant flooding event), no additional mitigation is required
- An allowable time of two weeks following dewatering of existing earthen channels or 1-2 days for existing concrete channels would encourage the Southern Bell Frog offsite.
- The Construction Environment Management Plan (CEMP) should include measures to make field staff aware of potential threatened fauna during works and understand the procedures if threatened fauna are detected.

Water quality

- Install appropriate sediment controls if there are areas of predicted sediment runoff.
- Soil stockpiles to be kept away from concentrated waterflow and covered if left for extended periods of time.
- Incorporate best management erosion and sediment control practices for the duration of the development.

Weeds and pest animals

- Ensure appropriate weed and pest controls are included in the CEMP.
- Ensure appropriate vehicle and footwear hygiene protocol is included in the CEMP.

Minor Works Review of Environmental Factors

Murrumbidgee Irrigation UCP – Environmental Planning Area 12 – Leeton Corbie Hill Laterals 7, 22, 23, 24

- Ensuring the vehicle and footwear hygiene is included in site inductions and toolbox talks.

3.2. Aboriginal cultural heritage

Table 3-2 Aboriginal cultural heritage

Description of existing environmental and potential impacts		
Would the proposal involve disturbance in any area that has not been subject to previous ground disturbances? The proposed works would comprise of excavation and pipeline works on land that has been subject to previous ground disturbance.	Yes ☐	No ☒
Has an online Aboriginal Heritage Information Management System (AHIMS) search been completed? On 18th March 2025, a search of the AHIMS database was undertaken over an area of approximately 1,400 km² centred on the Project Area. The AHIMS Client Service ID was 986269. There were 106 Aboriginal sites, and no declared Aboriginal Places recorded within the search area. Sites located in the area included artefact scatters, modified trees, hearths, Aboriginal ceremony and dreaming, burials, PAD, shell and stone arrangements. There are no Aboriginal sites recorded within or in close proximity to the Project area (Appendix H). The closest recorded sites are 2.7km to the west of the Project Area. These sites are modified trees in association with what appears to be an artificial waterbody but may be a natural modified waterbody.	Yes ☒	No ☐
Is there potential for the proposal to impact on any items of Aboriginal cultural heritage? An Aboriginal Heritage item was identified during the laydown site (Lot 96 DP751745) inspection of the southern laydown area off Corbie Hill Road.	Yes ☒	No ☐
Would the proposal involve the removal of mature native trees?	Yes ☐	No ☒

3.2.1. Detailed Aboriginal cultural heritage assessment

An Aboriginal Due Diligence Assessment (ADDA) was prepared for EA12 and is attached as Appendix H, in accordance with the sequence of steps identified in the NSW Office of Environment and Heritage's *Due Diligence Code of Practice for the Protection of Aboriginal Objects in NSW* (OEH 2010). The Code of Practice provides a stepped approach to determine if an activity is likely to cause harm to an Aboriginal object, as defined by the *NSW National Parks and Wildlife Act 1974*.

The following table outlines the summary of assessment for each section of the proposed works in relation to the potential for Aboriginal heritage items to occur.

Table 3-3 Summary of assessment for the proposed works in EA12

Location	Description	Conclusion
Approximately 3.3km from Main Canal to the north of Corbie Hill Road then loops back around. Laydown Area 2: approximately 107m x 310m on the northern side of Corbie Hill Road inside the eastern edge of the loop. Laydown Area 3: approximately 134m x 157m on the outside eastern edge of the loop.	The proposed new pipeline follows an existing channel of varying widths for 2.2km. A section of existing channel will be removed or decommissioned for 860m. This channel is surrounded by both pastoral land with non-native trees and remnant vegetation that does not appear to have been modified. There is potential for native old growth trees. Laydown Area 2 is located on the northeastern inside of the loop on the northern slope of the elevated rise within the grounds of a large residential holding. Vegetation appears to be non-native and is primarily grass and relatively undisturbed. Laydown Area 3 is located on the northwestern inside of the loop on the northern side of the elevated rise within the grounds of a large residential holding. Vegetation appears to be non-native including grass and relatively undisturbed.	Very low potential for Aboriginal heritage to occur along the channel and around Corbie Hill Road where previous disturbance has occurred. Moderate potential for Aboriginal heritage to occur on the elevated rise south of the caravan park and inside the northern loop where land modifications have been minimal.
Approximately 405m from Corbie Hill Road north along Curtin Road.	New pipeline is proposed along this section of the alignment which follows an existing channel along Corbie Hill Road then runs under Curtin Road. The alignment along Curtin Road is disturbed by the sealed road, house construction and associated infrastructure.	Very low potential for Aboriginal heritage to occur between road and channel.

It should be noted that the original Aboriginal Due Diligence Assessment for EA12 identified and assessed a greater number of potential laydown/compound areas and an overall larger area of impact from the proposed works than initially required. As such laydown/compound areas that were not relevant to the proposed works and adjustments in the areas of potentially required laydown/compound areas were made as necessary and are reflected in this MWREF.

3.2.2. Safeguards and mitigation measures

The proposed work can proceed with caution with the following recommendations:

- Unless these areas can be avoided by ground disturbing activity, the artefact recorded in Lot 96 DP751745 must be avoided. A buffer of 10m around the artefact will be marked, to avoid impacts. If it

cannot be avoided an Aboriginal Heritage Impact Permit (AHIP) will be required prior to works taking place in that location.

- A site inspection should occur for any remaining laydown areas.
- Works can proceed with caution in Lot 96 DP751745 within the areas that have been inspected, with full avoidance of the artefact recorded.
- Works can proceed in Lot 457 DP751745, however is not within the current scope of work for EA12.
- All other works must be constrained to the assessed areas. Any activity proposed outside of the current assessment areas should be subject to assessment.
- Wherever possible, all works should be confined to those areas between the road and the channel.
- If any items suspected of being Aboriginal in origin are discovered during the work, all work in the immediate vicinity must stop. The find will need to be assessed and if found to be an Aboriginal object must be reported to Heritage NSW.

MI is reminded that it is an offence under the *NSW National Parks and Wildlife Act 1974* to disturb, damage or destroy an Aboriginal object without a valid approval to do so.

3.3. Non-Aboriginal heritage

Table 3-4 Non-Aboriginal heritage

Description of existing environmental and potential impacts		
Have online heritage database searches been completed? • NSW Heritage database • Commonwealth Heritage List, established under the <i>Environment Protection and Biodiversity Conservation Act 1999</i> (EPBC Act) • Australian Heritage Places Inventory • Local Environmental Plan(s) heritage items. Searches of the relevant heritage databases were carried out on 18 June 2025. There are no listed non-Aboriginal heritage items in proximity or within the proposed works area.	Yes ☒	No ☐
Are there any items of non-Aboriginal heritage or heritage conservation areas listed on relevant heritage databases/registers that are located within the vicinity of the proposal? The nearest non-Aboriginal heritage listed item is an LEP listed Art Deco House – I10, located approximately 800m west of the proposed works.	Yes ☐	No ☒
Is the proposal likely to impact trees that form part of a heritage listing or have other heritage value? No trees consisting of any identified or listed local heritage item would be impacted by the proposed works.	Yes ☐	No ☒
Is the proposal likely to occur in or near features that indicate potential archaeological remains? The proposed works are not likely to occur in or near features that indicate potential archaeological remains. The work would predominantly be carried out within the MI managed land or the operational road corridor, which would have undergone disturbance during construction of the original road. The compound/laydown locations are also proposed within existing highly disturbed agricultural areas. Therefore, it is also unlikely for the compound/laydown locations to occur in or near features that indicate potential archaeological remains. The safeguards as provided below and in Section 4 would be used to manage any potential impacts.	Yes ☐	No ☒

3.3.1. Safeguards and mitigation measures

In the event that any unexpected substantial intact historic archaeological relics of State or local significance are unexpectedly discovered during the proposed works, the following management protocols will be implemented:

- Works at that identified heritage location will cease with an appropriate buffer zone of at least 20m to allow for the assessment and management of the find. All site personal will be informed about the buffer zone with no further works to occur within the buffer zone.
- A heritage specialist shall be engaged to inspect and assess the item.
- For items determined to be historic relics, work must remain ceased in the affected area and the Heritage Council must be notified in writing. This is in accordance with Section 146 of the *Heritage Act 1977* (NSW).
- Depending on the nature of the discovery, additional assessment may be required prior to the recommencement of work in the area. At a minimum, any find should be recorded by an archaeologist. In the event of discovery of human remain, contact the local police immediately.

3.4. Soil

Table 3-5 Soil

Description of existing environmental and potential impacts		
Are there any known occurrences of salinity or acid sulfate soils in the area? Available NSW data sources do not indicate the presence of saline or acid sulfate soils in the area.	Yes ☐	No ☒
Does the proposal involve the disturbance of large areas (e.g., >2ha) for earthworks? The proposed works (as a worst-case) could require approximately 7.13ha of earthworks if the entirety of the pipeline would be new pipeline constructed adjacent to the existing channel. The final area of disturbance is likely to be significantly less. Disturbed soil would be replaced with backfilling of topsoil likely occur on completion of works.	Yes ☐	No ☒
Does the site have constraints for erosion and sedimentation controls such as steep gradients or narrow corridors? No, the proposed works and compound/laydown areas are located on relatively flat landscapes.	Yes ☐	No ☒
Are there any sensitive receiving environments that are located in or nearby the likely proposal area or that would likely receive stormwater discharge from the proposal? Sensitive receiving environments include (but are not limited to) wetlands, state forests, national parks, nature reserves, rainforests, drinking water catchments). The nearest mapped waterways are a 2nd order stream (named Guises Creek), and an unnamed 3rd order stream (of the Strahler stream order) located approximately 10km south and northeast respectively. There are no wetlands, state forests, national parks, nature reserves, rainforests or drinking water catchments within receiving distance of the proposed works.	Yes ☐	No ☒
Is there any evidence within or nearby the likely footprint of potential contamination? There was one contaminated site as listed on the EPA's Section 58 register, as of 18 June 2025. There are five contaminated sites listed on the EPA's Section 60 register for the town of Leeton, with the closest site being the United Leeton Service Station approximately 1.2km from the proposed works. The proposed works are unlikely to impact or disturb any contaminated soil from this site.	Yes ☐	No ☒
Is the likely proposal footprint in or nearby highly sloping landform? No, the proposed works and compound/laydown areas are located on relatively flat	Yes ☐	No ☒

Description of existing environmental and potential impacts		
landscapes. Any risk of erosion or sedimentation would be minimal and mitigated with the below safeguards.		
Is the proposal likely to result in more than 2.5ha (area) of exposed soil? The proposed works could require approximately 7.13ha of earthworks if the entirety of the pipeline would be new pipeline constructed adjacent to the existing channel. The final area of disturbance is likely to be significantly less. Exposed soil would be limited and temporary during the construction phase, with backfilling to occur on completion of the proposed works.	Yes ☒	No ☐
Potential impacts Excavated soils will be replaced on completion of the works, assuming no contamination is identified. Any erosion risks during excavation would be mitigated with the below safeguards.		

3.4.1. Safeguards and mitigation measures

- Site management will incorporate best management erosion and sediment control practices such as those found in the Department of Housing's "Blue Book" (4th Edition) (OEH, 2004) on erosion and sediment control including:
 - At the commencement of the works, and progressively during the work install the required erosion control and sediment measures
 - Regularly inspect erosion and sediment controls, particularly following rainfall.
 - Maintain a register of inspection and maintenance of erosion control and sediment capture measures, where the duration of works at a single location is more than one shift.
 - Ensure that machinery leaves the site in a clean condition to avoid tracking sediment onto public roads.
 - In all excavation activities, separate subsoils and topsoils to ensure that they are replaced in their natural configuration to assist revegetation
 - Manage works in consideration of heavy rainfall events
 - Areas of disturbed soil would be rehabilitated promptly and progressively during investigation works.
 - Ensure a spill procedure is in place
- If contaminated areas are encountered during construction, appropriate control measures will be implemented to manage the immediate risks of contamination. All other works that may impact on the contaminated area will cease until the nature and extent of the contamination has been confirmed and any necessary site-specific controls or further actions identified in consultation with relevant government agencies
- Classify all excavated material in accordance with the EPA Waste Classification Guidelines (EPA, 2014). Dispose of or reuse material in accordance with its waste classification

3.5. Waterways and water quality

Table 3-6 Waterways and water quality

Description of existing environmental and potential impacts		
Is the proposal located within, adjacent to or near a waterway? The nearest mapped waterways are a 2 nd order stream (named Guises Creek), and an unnamed 3 rd order stream (of the Strahler stream order) located approximately 10km south and northeast respectively.	Yes ☐	No ☒
Is the location known to flood or be prone to water logging? The proposed works are not located within mapped flood liable land as per the Leeton Shire Council Flood study (Leeton Shire Council, 2014).	Yes ☐	No ☒
Is the proposal located within a regulated catchments covered by chapter 6 of State Environmental Planning Policy (Biodiversity and Conservation) 2021 (SEPP (Biodiversity and Conservation))?	Yes ☐	No ☒
Would the proposal be undertaken on a bridge or ferry?	Yes ☐	No ☒
Is the proposal likely to require the extraction of water from a local water course (not mains)?	Yes ☐	No ☒
The proposed works involve the disturbance of soils by way excavation for the new pipelines. These works would pose minimal risk to any nearby waterways, and any impacts would be mitigated by following the below safeguards.		

3.5.1. Safeguards and mitigation measures

- No dirty water may be released into drainage lines and/or waterways
- Water quality control measures are to be used where relevant to prevent any materials (e.g., concrete, grout, sediment) entering drain inlets or waterways.
- Store any fuels, chemical and hazardous materials in secure, bunded areas and at least 40m from all waterways.
- An emergency spill kit will be kept on site at all times. All staff are to be made aware of the location of the spill kit and trained in its use.

3.6. Noise and vibration

A distance-based assessment using the three noisiest plant was undertaken using TFNSW's Construction Noise Estimator Tool (CNET) to determine the extent of noise impacts on the locality. Due to the proximity to road corridors and nearby privately owned premises, the existing noise area is categorised as R2 noise category area.

Table 3-7 Noise and vibration

Description of existing environmental and potential impacts		
Are there any residential properties or other noise sensitive areas near the location of the proposal that may be affected by the work (i.e., church, school, hospital)? Noise modelling was undertaken for both daytime standard construction hours and nightworks, and illustrated Figure 3-2 and Figure 3-3 below. The noise modelling indicated that: • During day construction hours: ○ 17 receivers are within the Highly Intrusive Noise Catchment Area (NCA1) ○ 4 receivers are within the Moderately Intrusive NCA2 • During nightworks: ○ 21 receivers are within the Highly Intrusive NCA1 ○ 14 receivers are within the Moderately Intrusive NCA2 ○ 23 receivers are within the Clearly Audible NCA3 ○ 38 receivers are within the Noticeable NCA4 These would be expected to only be temporary, with the duration of works only being 6 – 12 weeks. Through implementing the safeguards and mitigation measures outlined below, the noise impacts for all identified receivers would be expected to be low.	Yes ☒	No ☐
Is the proposal going to be undertaken only during standard working hours? Standard construction working hours for Leeton LGA are: • Monday to Friday: 7:00am to 6:00pm • Saturday: 7:00am to 6:00pm • Sunday: 7:00am to 6:00pm • Public Holidays: 7:00am to 6:00pm The construction taking place outside of working hours is considered beneficial to the overall project as it will reduce impact and delays to the local public transport services (e.g. school buses) during the week. It should be noted that a diesel pump may be required to operate outside the standard working hours (worst-case over a 24hr period), to dewater the existing channels or	Yes ☐	No ☒

supply water.		
Is any explosive blasting required for the proposal?	Yes ☐	No ☒
Would construction noise or vibration from the proposal affect sensitive receivers? The proposed works would have the potential to affect up to 21 sensitive receivers during standard construction hours and up to 96 outside of standard construction hours, as outlined above. It is anticipated that any impacts would be able to be mitigated by the recommended measures, and any residual impacts would be minimal due to the short-term durations of the works. No vibration intensive equipment listed in the NSW <i>Construction Noise and Vibration Guideline</i> (CNVG) are expected to be used for this proposal. As such, the proposal would not result in vibration being experienced by any surrounding properties or infrastructure.	Yes ☒	No ☐
Would operation of the proposal alter the noise environment for sensitive receivers? Following completion of the proposal, there would be no operational change in the noise environment.	Yes ☐	No ☒
Would the proposal result in vibration being experienced by any surrounding properties or infrastructure during operation?	Yes ☐	No ☒

3.6.1. Noise detailed assessment

Criteria

For construction, the background noise level (LA90) was determined by the method described in the *NSW Noise Policy* for Industry (EPA, 2017). The “Energy Average Noise Level” during construction activities, evaluated over a measurement period of 15 minutes. This is the main parameter used to assess the construction noise impacts. The LAeq (15 minute) construction noise objectives are based on an allowance margin above the LA90 background noise levels.

The existing noise conditions of the area would be similar to a typical rural agricultural setting. This may include the use of heavy agricultural machinery and existing operational irrigation infrastructure (diesel pump stations). These are considered to be a common contributors to the existing noise environment. The potential cumulative noise impacts arising from the proposed works have are detailed below.

The Noise Management Level (NML) is determined by the existing noise area R2, which is 55dB(A) for standard hours works and 45dB(A) for night works.

Noise modelling was conducted around the investigation locations, with the areas around these points divided into the following Noise Catchment Areas (NCA) to represent the changes in ambient noise levels and to assess the levels of impact.

Table 3-8 Noise Catchment Areas

Day	
NCA	Description
NCA1 – Highly intrusive (15m)	Noise catchment area directly adjacent to the proposal site with direct line of sight to the construction works and predicted to be exposed to LAeq(15min) construction noise levels >30dB(A) above the applicable construction NML
NCA2 – Moderately intrusive (30m)	Noise catchment area predicted to be exposed to LAeq(15min) construction noise levels that are between 20dB(A) and 30dB(A) above the applicable NML.
NCA3 – Maximum Affected Distance (85m)	Noise catchment area predicted to be the maximum distance from the proposed works where noise level above background may be noticeable but would not require any additional measures for noise mitigation.
Night	
NCA1 – Highly intrusive (35m)	Noise catchment area directly adjacent to the proposal site with direct line of sight to the construction works and predicted to be exposed to LAeq(15min) construction noise levels >30dB(A) above the applicable construction noise management level (NML).
NCA2 – Moderately intrusive (95m)	Noise catchment area predicted to be exposed to LAeq(15min) construction noise levels that are between 30dB(A) and 20dB(A) above the applicable NML.
NCA3 – Clearly audible (220m)	Noise catchment area predicted to be exposed to LAeq(15min) construction noise levels that are between 20dB(A) and 10dB(A) above the applicable NML.
NCA4 – Noticeable	Noise catchment area predicted to be exposed to LAeq(15min) construction noise

(335m)	levels that are <10dB(A) above the applicable NML.
--------	--

Potential impacts

Construction

Potential construction noise impacts have been measured from the proposed works maximum area (10m buffer either side of the proposed new pipeline). Noise catchment were identified, the extents of which are outlined in Table 3-8, and displayed in the figures below. Note that vehicle noise from the compound/laydown areas were not modelled, as the vehicle movements to/from the areas would be brief and would not occur in a standard back/forth fashion as with typical works within a road corridor.

Table 3-9 Residential noise estimates for works during standard construction work hours

NCA (Extention from propsoed works area)	NML (dB(A))	NML Exceedance dB(A)	Recommended additional mitigation measures*
Day			
NCA1 (15m)	55	>30	N, PC, RO
NCA2 (30m)	55	20<30	N
NCA3 (85m)	55	Nil	Nil
Night			
NCA1 (35m)	45	>30	N, PC, SN
NCA2 (95m)	45	20<30	N, PC, SN
NCA3 (220m)	45	10<20	N
NCA4 (335m)	45	5<10	N

*AA=Alternative Accomodation, SN=Specific Notifications, N=Notification, PC=Phone Call, RO=Respite Offer, R2=Respite Period 2, DR=Duration Respite

Day Time

As shown in Figure 3-2 here would be up to 21 sensitive receivers expected to receive noise impacts from construction works undertaken during standard construction hours. Of these receivers:

- 17 receivers are expected to experience highly intrusive noise impacts (>30 dB(A))
- 4 receivers are expected to experience moderately intrusive noise impacts (20<30 dB(A))

The safeguards and mitigation measures set out in Section 3.6.2 would readily mitigate the expected noise impacts. In addition to these measures, the following mitigation measures, as given by the CNET, should be implemented:

- For NCA1

- Notification (letterbox drop or equivalent) of prior warning of works and potential disruptions can assist in reducing the impact on the community. Notification should be a minimum of five working days prior to the start of works.
- Phone calls detailing relevant information made to identified/affected stakeholders, who have provided their contact details, within seven calendar days of proposed work.
- Respite Offers should be considered where there are high noise and vibration generating activities near receivers. The purpose of such an offer is to provide residents with respite from an ongoing impact. This measure is evaluated on a project-by-project basis.
- For NCA2
 - Notification (letterbox drop or equivalent)

It should be noted that the noise assessment has been determined based off the noisiest plant in operation with clear line of sight to the receiver. The assessment does not take into consideration existing intervening vegetation, structures, and topography. As such, this provides a worst-case scenario with actual noise impacts expected to be lower than those identified.

Nighttime

As shown in Figure 3-3 here would be up to 96 sensitive receivers expected to receive noise impacts from construction works undertaken outside of the standard working hours. Of these receivers:

- 21 receivers are expected to experience highly intrusive noise impacts (>30 dB(A))
- 14 receivers are expected to experience moderately intrusive noise impacts (20<30 dB(A))
- 23 receivers are expected to experience clearly audible noise impacts (10<20 dB(A))
- 38 receivers are expected to experience noticeable noise impacts (5<10 dB(A))

While there are a large number of sensitive receivers for the nighttime works, the diesel pump would only be operating in discrete locations within the proposed works area, not along the entirety of the pipeline works. Therefore, only a small portion of the total identified sensitive receivers would be impacted and require notification as part of the nighttime construction works. However, as these discrete locations are not yet known, the entirety of the proposed works area was assessed to capture all potential affected sensitive receivers.

The safeguards and mitigation measures set out in Section 3.6.2 would readily mitigate the expected noise impacts. In addition to these measures, the following mitigation measures, as given by the CNET, should be implemented:

- For NCA1
 - Specific notification (letterbox or equivalent) to identified stakeholders no later than five days ahead of construction activities. Specific notification provides additional information when relevant and informative to more highly affected receivers.
 - Notification (letterbox drop or equivalent) of prior warning of works and potential disruptions can assist in reducing the impact on the community. Notification should be a minimum of five working days prior to the start of works.
 - Phone calls detailing relevant information made to identified/affected stakeholders, who have provided their contact details, within seven calendar days of proposed work.
 - Due to the short duration of works, other measures such as verification monitoring, respite periods and duration reductions are not considered practical mitigation options as these would extend the overall duration of works and subsequent noise impacts.
- For NCA2

- Specific notification (letterbox or equivalent) to identified stakeholders no later than five days ahead of construction activities. Specific notification provides additional information when relevant and informative to more highly affected receivers.
- Notification (letterbox drop or equivalent) of prior warning of works and potential disruptions can assist in reducing the impact on the community. Notification should be a minimum of five working days prior to the start of works.
- Phone calls detailing relevant information made to identified/affected stakeholders, who have provided their contact details, within seven calendar days of proposed work.
- Again, other mitigation measures are not considered practical for NCA2
- For NCA3
 - Notification (letterbox drop or equivalent) of prior warning of works and potential disruptions can assist in reducing the impact on the community. Notification should be a minimum of five working days prior to the start of works.
- For NCA4
 - Notification (letterbox drop or equivalent) of prior warning of works and potential disruptions can assist in reducing the impact on the community. Notification should be a minimum of five working days prior to the start of works.

It should be noted that the noise assessment has been determined based off the noisiest plant operation with clear line of sight to the receiver. The assessment does not take into consideration existing intervening vegetation, structures, and topography. As such, this provides a worst-case scenario with actual noise impacts expected to be lower than those identified.

Operation

As the proposed works would not result in any permanent structures above natural ground level or change to existing structures, there would be no change in the operational noise or vibration environments.

Note this scenario is calculated as a worst-case situation and it is unlikely that the diesel pumps would be operated outside of the standard working areas, as such the above noise assessment is capturing a worst case scenario.

Figure 3-2 Noise catchment areas – standard construction work hours

Figure 3-3 Noise catchment areas – standard construction work hours (nighttime)

3.6.2. Safeguards and mitigation measures

- Implementation of the above recommended additional mitigation measures for receivers affected by standard construction work hours (daytime):
 - Notification in the form of letter box drops and/or individual doorknocking for affected receivers in NCA1 and NCA2
 - Within this notification direct contact details for the construction manager would be provided to potential affected receivers.
 - Phone calls for affected receivers in NCA1 if required
 - Respite Offer for affected receivers in NCA1 if required
- Implementation of the above recommended additional mitigation measures for receivers affected by outside of standard construction work hours (nighttime):
 - Notification and specific notification in the form of letter box drops for affected receivers in NCA1 and NCA2
 - Phone calls for affected receivers in NCA1
- Ensuring that noisy plant and equipment are not operated simultaneously where avoidable.
- Switching off plant and equipment when not in use.
- Consider the use of non-tonal reverse beepers and ambient sensitive alarms (that adjust noise output relative to the ambient level) where practicable.
- All employees, contractors and subcontractors are to receive an environmental induction. The induction must at least include:
 - All project specific and relevant standard noise and vibration mitigation measures
 - Relevant licence and approval conditions
 - Permissible hours of work
 - Any limitations on high noise generating activities
 - Location of nearest sensitive receivers
 - Construction employee parking areas
 - Designated loading / unloading areas and procedures
 - Site opening/closing times
 - Environmental incident procedures

3.7. Landscape character and visual amenity

Table 3-10 Landscape character and visual amenity

Description of existing environmental and potential impacts		
Is the proposed work over or near an important physical or cultural element or landscape? (For example, heritage items and areas, distinctive or historic built form, National Parks, conservation areas, scenic highways etc.) As stated in Section 3.3, the nearest non-Aboriginal heritage listed item is an LEP listed Art Deco House – I10, located approximately 800m west of the proposed works. As works would be restricted to MI managed land or within the road corridor, there is little risk of impacts from the proposed works.	Yes ☐	No ☒
Would the proposal obstruct or intrude upon the character or views of a valued landscape or urban area? (For example, locally significant topography, a rural landscape or a park, a river, lake or the ocean or a historic or distinctive townscape or landmark) The proposed works would not result in the construction of any new structures or features that would obstruct or intrude on the character or views of local landscapes. The works would also be temporary, with no lasting impact after the works are complete	Yes ☐	No ☒
Would the proposal require the removal of mature trees or stands of vegetation, either native or introduced? Potential trimming or clearing of mature trees could be required for new pipelines. However, do not form part of an important streetscape.	Yes ☐	No ☒
Would the proposal result in large areas of shotcrete visible from the road or adjacent properties?	Yes ☐	No ☒
Would the proposal involve new noise walls or visible changes to existing noise walls?	Yes ☐	No ☒
Would the proposal involve the removal or reuse of large areas of road corridor, landscape, either verges or medians?	Yes ☐	No ☒
Would the proposal involve substantial changes to the appearance of a bridge (including piers, girders, abutments and parapets) that are visible from the road or residential areas?	Yes ☐	No ☒
If involving lighting, would the proposal create unwanted light spillage on residential properties at night (in construction or operation)?	Yes ☐	No ☒

Description of existing environmental and potential impacts

Would any new structures or features to be constructed, result in over shadowing to adjoining properties or areas?

Yes ☐

No ☒

There would be a small impact to landscape character or visual amenity as a result of the proposed works. This would be temporary and limited to the construction period and would not have any lasting impacts on landscape character or visual amenity following the completion of works.

3.7.1. Safeguards and mitigation measures

- Contain all work within the boundaries designated on the site plan
- Work areas shall be maintained in an orderly manner
- On completion of the works, all vehicles, construction equipment, materials, and refuse relating to the works shall be removed from the work site(s) and any adjacent affected areas
- All exposed areas shall be stabilised with the excavated topsoil being placed back on site as soon as possible. Remove temporary erosion and sediment controls from the site once landforms have been assessed as stable.

3.8. Air quality and climate change

Table 3-11 Air quality

Description of existing environmental and potential impacts		
Is the proposal likely to result in large areas (>2ha) of exposed soils? The proposed works could require approximately 7.13ha (worst-case scenario) of earthworks if the entirety of the pipeline would be new pipeline constructed adjacent to the existing channel. The final area of disturbance is likely to be significantly less. Disturbed soil would be replaced with backfilling of topsoil likely occur on completion of works.	Yes ☒	No ☐
Are there any dust-sensitive receivers located within the vicinity of the proposal during the construction period? Depending on the specific location of the proposed works for EA12, soil moisture and weather conditions, there is potential for dust generation resulting in a localised nuisance. The potential impact has been addressed by the proposed safeguards.	Yes ☒	No ☐
Is there likely to be an emission to air during construction? Dust would be produced by the excavations undertaken as part of the proposed works. Similarly, there would be some particulate emissions from the use of plant and equipment. The potential impact from emissions is expected to be low given the works are not in a high-density residential area and areas of exposed soil would be limited. Any residual impacts from emissions would be managed with the appropriate implementation of safeguards listed below.	Yes ☒	No ☐

Table 3-12 Climate change

Description of existing environmental and potential impacts		
Is the proposal located in an area likely to be permanently or tidally inundated in the future or subject to increased duration and intensity of flooding?	Yes ☐	No ☒
Have opportunities for reduced energy consumption during construction and operation been considered. The proposed works will be for a limited time, and as such opportunities for reducing the energy consumption are limited.	Yes ☒	No ☐
Greenhouse gas emissions sources during construction are likely to be largest from: Transporting materials to site.		

Description of existing environmental and potential impacts

- Operation of plant and equipment.

There would be no operational sources of greenhouse gasses arising from the proposed works

3.8.1. Safeguards and mitigation measures

- Works are not to be carried out during strong winds or in weather conditions where high levels of dust or air borne particulates are likely
- Vegetation or other materials are not to be burnt on site
- Vehicles and vessels transporting waste or other materials that may produce odours or dust are to be covered during transportation
- Vehicles and equipment are to be maintained in good working order
- Measures (including watering or covering exposed areas) are to be used to minimise or prevent air pollution and dust
- Do not leave vehicles idling.

3.9. Traffic and transport

Table 3-13 Traffic and transport

Description of existing environmental and potential impacts		
Is the proposal likely to result in detours or disruptions to traffic flow (vehicular, cycle and pedestrian) or access during construction? Minor traffic disruptions may occur when plant and equipment is transported to the proposed works location, and when construction activities are conducted across Curtin Road and Corbie Hill Road. A Traffic Management Plan (TMP) would be prepared and would likely involve speed reductions or short lane closures around work sites. Traffic would remain able to pass work sites and access nearby properties throughout the duration of works. Traffic control measures would be demobilised at the conclusion of each work shift.	Yes ☒	No ☐
Is the proposal likely to result in detours or disruptions to traffic flow (vehicular, cycle and pedestrian) or access during operation? No operational changes would occur once works are complete.	Yes ☐	No ☒
Is the proposal likely to affect any other transport nodes or transport infrastructure (e.g., bus stops, bus routes) in the surrounding area? Or result in detours or disruptions to traffic flow (vehicular, cycle and pedestrian) or access during operation? No transport nodes, or vehicular, cycle or pedestrian access would be affected during operation, and no changes would be present following completion of the proposal.	Yes ☐	No ☒
The proposed works may have minor impacts on traffic during construction and the delivery of plant equipment, but the proposal would not permanently alter any existing traffic arrangements during operation. Any impacts would be mitigated by the implementation of the below safeguards.		

3.9.1. Safeguards and mitigation measures

- Where possible, current traffic movements and property access are to be maintained during the construction works. Any disturbance is to be minimised to prevent unnecessary traffic delays.
- A Traffic Management Plan (TMP) will be prepared in accordance with the relevant guidelines and procedures.

3.10. Socio-economic

Table 3-14 Socio-economic

Description of existing environmental and potential impacts		
Is the proposal likely to impact on local business?	Yes ☐	No ☒
Is the proposal likely to require any property acquisition? The proposed works would not require any property acquisition, however, access may be required to a number of private lots to undertake the works. Access agreements must be sought by all property owners.	Yes ☒	No ☐
Is the proposal likely to alter any access for properties (either temporarily or permanently)? Temporary access restrictions may apply where access culverts are removed and replaced with pipeline infrastructure within the same day. MI customer engagement will negotiate timing with affected customers.	Yes ☒	No ☐
Is the proposal likely to alter any on-street parking arrangements (either temporarily or permanently)? Temporary alterations to on street parking may apply to along Curtin Road as part of the construction works at EA12 due to underboring at the intersection of Curtin Road and Corbie Hill Road.	Yes ☒	No ☐
Is the proposal likely to change pedestrian movements or pedestrian access (either temporarily or permanently)? As outlined in Section 3.9, there may be some temporary traffic, including pedestrian traffic) disruptions on Curtin Road and Corbie Hill Road when construction works are required within the road corridor. There would be no permanent impacts on pedestrian movements.	Yes ☒	No ☐
Is the proposal likely to impact on any items or places of social value to the community (either temporarily or permanently)?	Yes ☐	No ☒
Is the proposal likely to reduce or change visibility of any businesses, farms, tourist attractions or the like (either temporarily or permanently)? No permanent changes to landscape would arise from the proposed works	Yes ☐	No ☒
Is the proposal likely to impact trees planted by a community group, Landcare group or by council or a tree that is a memorial or part of a memorial group	Yes ☐	No ☒

Description of existing environmental and potential impacts		
e.g., has a plaque?		
Is the proposal likely to impact trees that form part of a streetscape, an avenue or roadside planting?	Yes ☐	No ☒

3.10.1. Safeguards and mitigation measures

- Any complaints received during the undertaking of the works are to be recorded and addressed within a reasonable time
- Obtain appropriate landholder consent for works on private land.

3.11. Waste

Table 3-15 Waste

Description of existing environmental and potential impacts		
Is the proposal likely to generate >200 tonnes of waste material (contaminated and /or non-contaminated material)?	Yes ☐	No ☒
Is the proposal likely to require a licence from EPA?	Yes ☐	No ☒
Is the proposal likely to require the removal of asbestos?	Yes ☐	No ☒
The main waste streams would include small amounts of asphalt and road base, excess soil and excavated material, and small amounts of construction piping material.		

3.11.1. Safeguards and mitigation measures

- Classify all excavated material in accordance with the EPA Waste Classification Guidelines (EPA, 2014). Dispose of or reuse material in accordance with its waste classification.
- Waste material, other than vegetation mulch, is not to be left on site once the works have been completed (refer back to Section 3.4.1).
- Resource management hierarchy principles are to be followed (in accordance with the Waste Avoidance and Resource Recovery Act 2001):
 - Avoid unnecessary resource consumption as a priority.
 - Avoidance is followed by resource recovery (including reuse of materials, reprocessing, recycling and energy recovery).
 - Disposal is undertaken as a last resort.

3.12. Cumulative impacts

Table 3-16 Cumulative impacts

Description of existing environmental and potential impacts		
Are there other projects and developments in the study area which could add to potential impacts in both construction and operation? A search of the Leeton Shire Council Development Applicant tracker and a search of the NSW Major Project Portal on the 18 June 2025 found no other projects or developments in the wider locality which would add to potential impacts arising from this proposed works. There is the potential that the proposed works in other areas of the broader UCP project would be undertaken concurrently with the proposed works for EA12. While this may constitute some cumulative impacts in relation to traffic and social, the works would be completed over a small timeframe of approximately 6 - 12 weeks. Therefore, the cumulative impacts are expected to be low.	Yes ☐	No ☒

3.12.1. Safeguards and mitigation measures

No additional safeguards are proposed.

4. Summary of proposed safeguards and mitigation measures

4.1. Safeguards and mitigation measures

Table 4-1 Summary of proposed safeguards and mitigation measures

Environmental factor	Safeguards	Relevant Section
Biodiversity	Vegetation - Establishing a Tree Protection Zone (TPZ) around trees and patches of native vegetation that will be retained (areas of PCT 82) but are adjacent to construction works - Strategic lopping of branches is allowed as long as no trees or shrubs are completely removed. - All fallen timber and deadwood within the proposed works area should be retained or relocated to an adjacent area with the Proposal site. - As much as is reasonable, proposed works should be contained to the existing channel footprint so as to reduce the direct impacts to areas of TPZs (areas of PCT 82). Threatened species and migratory species - Avoiding undergoing works (as far as practical) in Spring or Summer, which is when Southern Bell Frog are most active and the most likely to utilise the irrigation channels. As reasonable, undergo as much works in Autumn and Winter. - If works are to be completed in Spring and Summer; c. a fauna spotter catcher can be on site to confirm if Southern Bell Frog is present, only if a recent, significant rise in water has occurred (a significant flooding event). Or;	Section 3.1

Environmental factor	Safeguards	Relevant Section
	d. If rain events are not significant enough to create a rise in water that would retain water for at least a four-month period (a significant flooding event), no additional mitigation is required - An allowable time of two weeks following dewatering of existing earthen channels or 1-2 days for existing concrete channels would encourage the Southern Bell Frog offsite. - The Construction Environment Management Plan (CEMP) should include measures to make field staff aware of potential threatened fauna during works and understand the procedures if threatened fauna are detected. Water quality - Install appropriate sediment controls if there are areas of predicted sediment runoff. - Soil stockpiles to be kept away from concentrated waterflow and covered if left for extended periods of time. - Incorporate best management erosion and sediment control practices for the duration of the development. Weeds and pest animals - Ensure appropriate weed and pest controls are included in the CEMP. - Ensure appropriate vehicle and footwear hygiene protocol is included in the CEMP. - Ensuring the vehicle and footwear hygiene is included in site inductions and toolbox talks.	
Aboriginal heritage	The proposed work can proceed with caution with the following recommendations: - Unless these areas can be avoided by ground disturbing activity, the artefact recorded in Lot 96 DP751745 must be avoided. A buffer of 10m around the artefact will be marked, to avoid impacts. If it cannot be avoided an Aboriginal Heritage Impact Permit (AHIP) will be required prior to works taking place in that location. - A site inspection should occur for any remaining laydown areas. - Works can proceed with caution in Lot 96 DP751745 within the areas that have been inspected, with full	Section 3.2

Environmental factor	Safeguards	Relevant Section
	avoidance of the artefact recorded. • Works can proceed in Lot 457 DP751745, however is not within the current scope of work for EA12. • All other works must be constrained to the assessed areas. Any activity proposed outside of the current assessment areas should be subject to assessment. • Wherever possible, all works should be confined to those areas between the road and the channel. • If any items suspected of being Aboriginal in origin are discovered during the work, all work in the immediate vicinity must stop. The find will need to be assessed and if found to be an Aboriginal object must be reported to Heritage NSW. • MI is reminded that it is an offence under the <i>NSW National Parks and Wildlife Act 1974</i> to disturb, damage or destroy and Aboriginal object without a valid approval to do so.	
Non-Aboriginal heritage	In the event that any unexpected substantial intact historic archaeological relics of State or local significance are unexpectedly discovered during the proposed works, the following management protocols will be implemented: • Works at that identified heritage location will cease with an appropriate buffer zone of at least 20m to allow for the assessment and management of the find. All site personal will be informed about the buffer zone with no further works to occur within the buffer zone. • A heritage specialist shall be engaged to inspect and assess the item. • For items determined to be historic relics, work must remain ceased in the affected area and the Heritage Council must be notified in writing. This is in accordance with Section 146 of the <i>Heritage Act 1977</i> (NSW). • Depending on the nature of the discovery, additional assessment may be required prior to the recommencement of work in the area. At a minimum, any find should be recorded by an archaeologist. In the event of discovery of human remain, contact the local police immediately.	Section 3.3
Soil	• Site management will incorporate best management erosion and sediment control practices such as those found in	Section 3.4

Environmental factor	Safeguards	Relevant Section
	the Department of Housing’s “Blue Book” (4th Edition) on erosion and sediment control including: ○ At the commencement of the works, and progressively during the work install the required erosion control and sediment measures ○ Regularly inspect erosion and sediment controls, particularly following rainfall. ○ Maintain a register of inspection and maintenance of erosion control and sediment capture measures, where the duration of works at a single location is more than one shift. ○ Ensure that machinery leaves the site in a clean condition to avoid tracking sediment onto public roads. ○ In all excavation activities, separate subsoils and topsoils to ensure that they are replaced in their natural configuration to assist revegetation ○ Manage works in consideration of heavy rainfall events ○ Areas of disturbed soil would be rehabilitated promptly and progressively during investigation works. ○ Ensure a spill procedure is in place ● If contaminated areas are encountered during construction, appropriate control measures will be implemented to manage the immediate risks of contamination. All other works that may impact on the contaminated area will cease until the nature and extent of the contamination has been confirmed and any necessary site-specific controls or further actions identified in consultation with relevant government agencies ● Classify all excavated material in accordance with the EPA Waste Classification Guidelines. Dispose of or reuse material in accordance with its waste classification	
Waterways and water quality	● No dirty water may be released into drainage lines and/or waterways ● Water quality control measures are to be used where relevant to prevent any materials (e.g., concrete, grout, sediment) entering drain inlets or waterways. ● Store any fuels, chemical and hazardous materials in secure, bunded areas and at least 40m from all waterways. ● An emergency spill kit will be kept on site at all times. All staff are to be made aware of the location of the spill kit and trained in its use.	Section 3.5

Environmental factor	Safeguards	Relevant Section
Noise and vibration	- Implementation of the above recommended additional mitigation measures for receivers affected by standard construction work hours (daytime): - Notification in the form of letter box drops and/or individual doorknocking for affected receivers in NCA1 and NCA2 - Within this notification direct contact details for the construction manager would be provided to potential affected receivers. - Phone calls for affected receivers in NCA1 if required - Respite Offer for affected receivers in NCA1 if required - Implementation of the above recommended additional mitigation measures for receivers affected by outside of standard construction work hours (nighttime): - Notification and specific notification in the form of letter box drops for affected receivers in NCA1 and NCA2 - Phone calls for affected receivers in NCA1 - Ensuring that noisy plant and equipment are not operated simultaneously where avoidable. - Switching off plant and equipment when not in use. - Consider the use of non-tonal reverse beepers and ambient sensitive alarms (that adjust noise output relative to the ambient level) where practicable. - All employees, contractors and subcontractors are to receive an environmental induction. The induction must at least include: - All project specific and relevant standard noise and vibration mitigation measures - Relevant licence and approval conditions - Permissible hours of work - Any limitations on high noise generating activities - Location of nearest sensitive receivers - Construction employee parking areas	Section 3.6

Environmental factor	Safeguards	Relevant Section
	○ Designated loading / unloading areas and procedures ○ Site opening/closing times ○ Environmental incident procedures	
Landscape character and visual amenity	• Contain all work within the boundaries designated on the site plan • Work areas shall be maintained in an orderly manner • On completion of the works, all vehicles, construction equipment, materials, and refuse relating to the works shall be removed from the work site(s) and any adjacent affected areas • All exposed areas shall be stabilised with the excavated topsoil being placed back on site as soon as possible. Remove temporary erosion and sediment controls from the site once landforms have been assessed as stable	Section 3.7
Air quality and climate	• Works are not to be carried out during strong winds or in weather conditions where high levels of dust or air borne particulates are likely. • Vegetation or other materials are not to be burnt on site. • Vehicles and vessels transporting waste or other materials that may produce odours or dust are to be covered during transportation. • Vehicles and equipment are to be maintained in good working order. • Measures (including watering or covering exposed areas) are to be used to minimise or prevent air pollution and dust • Do not leave vehicles idling.	Section 3.8
Traffic and transport	• Where possible, current traffic movements and property access are to be maintained during the construction works. Any disturbance is to be minimised to prevent unnecessary traffic delays. • A Traffic Management Plan (TMP) will be prepared in accordance with the relevant guidelines and procedures.	Section 3.9

Environmental factor	Safeguards	Relevant Section
Socio-economic	- Any complaints received during the undertaking of the works are to be recorded and addressed within a reasonable time - Obtain appropriate landholder consent for works on private land.	Section 3.10
Waste	- Classify all excavated material in accordance with the EPA Waste Classification Guidelines (EPA, 2014). Dispose of or reuse material in accordance with its waster classification. - Waste material, other than vegetation mulch, is not to be left on site once the works have been completed (refer back to Section 3.4.1). - Resource management hierarchy principles are to be followed (in accordance with the Waste Avoidance and Resource Recovery Act 2001): - Avoid unnecessary resource consumption as a priority. - Avoidance is followed by resource recovery (including reuse of materials, reprocessing, recycling and energy recovery). - Disposal is undertaken as a last resort.	Section 3.11
Cumulative impacts	N/A	Section 3.12

4.2. Licensing and approvals

Table 4-2 Summary of licensing and approvals required

Instrument	Requirement	Timing
<i>Water Act 1912</i> (s10 / s18F)	Licence and/or permit for construction or use of a 'work' (e.g., water conservation, irrigation, water supply, drainage or changing the course of a river) for certain purposes from DPE (Water).	Prior to start of the activity.
Roads Act 1993	Road Occupancy Licence (ROL) - Approval under Section 138 of the Roads Act from the appropriate road authority prior to works on roads or closures of lanes	Prior to work on roads

5. Summary of impacts

Environmental factor	Potential impacts	Relevant Section	Need for further assessment? (Y/N)
Biodiversity	- One HBT was identified within one of the proposed laydown areas (refer to Figure 3-1). If the proposed laydown area with the HBT is used a tree protection zone (TPZ) should be established around this tree to avoid any direct or indirect impacts. - Within the proposed development of EA12 there is 1.29ha of PCT 82 <i>Western Grey Box - Poplar Box - White Cypress Pine tall woodland</i>. PCT 82 is associated with TECs: - BC Act listed <i>Inland Grey Box Woodland in the Riverina, NSW South Western Slopes, Cobar Peneplain, Nandewar and Brigalow Belt South Bioregions</i>. - EPBC Act listed <i>Grey Box (Eucalyptus microcarpa) Grassy Woodlands and Derived Native Grasslands of South-eastern Australia</i>. - As long as there is no removal of vegetation within these existing patches of PCT 82, further assessment will not be triggered. - No direct impacts to any threatened species are expected, with the exception of threatened birds, such as Grey Falcon, Australasian Bittern and Southern Whiteface, that would use the channel for foraging habitat. However, as birds are more mobile than most species, these impacts are considered negligible - Southern Bell Frog (<i>Litoria raniformis</i>) could potentially use the channel for habitat, and adjacent areas to the channel, as foraging habitat - The ToS found that the proposed development is not likely to have a significant impact on the Southern Bell Frog due to the lack of records within and near the proposed development and the limited habitat suitability that irrigation channels provide for the species - The AoS found that the proposed development is not likely to have a significant impact on the Southern Bell Frog due to the lack of records within and near the proposed	Section 3.1	N

Environmental factor	Potential impacts	Relevant Section	Need for further assessment? (Y/N)
	development and the limited suitability that irrigation channels provide for the species As such, the overall potential impact of the proposed works on biodiversity would be low.		
Aboriginal heritage	- The potential for the proposed work activities in EA12 to disturb Aboriginal heritage objects or sensitive landscape features is low although, it cannot be entirely discounted in those portions of adjacent land that have far less disturbances. - There are no previously recorded AHIMS sites within or in close proximity to the proposed works areas - The site survey identified one Aboriginal heritage item/s or sites within EA12 or associated compound/laydown areas - As such, the overall potential impact of the proposed impacts on Aboriginal heritage would be low.	Section 3.2	N
Non-Aboriginal heritage	Proposed works are unlikely to impact any non-Aboriginal heritages items or sites.	Section 3.3	N
Soil	- Approximately 7.13ha of earthworks could be required as part of the proposed works. Exposed soil would be limited and temporary during the construction phase, with backfilling to occur on completion of the proposed works. - The risk of soil erosion or sedimentation would be minimal with the incorporation of best management erosion and sediment control practices - As such, the potential impacts to soil as a result of the proposed works would be low.	Section 3.4	N
Waterways and water quality	- The proposed works involve the disturbance of soils by way excavation for the new pipelines. These works would pose minimal risk to any nearby waterways, and any impacts would be mitigated outlined. - As such, the potential impacts to waterways and water quality as a result of the proposed works would be negligible.	Section 3.5	N
Noise and	There would be up to 21 sensitive receivers expected to receive noise impacts from construction	Section 3.6	N

Environmental factor	Potential impacts	Relevant Section	Need for further assessment? (Y/N)
vibration	works undertaken during standard construction hours. Of these receivers: 17 receivers are expected to experience highly intrusive noise impacts (>30 dB(A)) 4 receivers are expected to experience moderately intrusive noise impacts (20<30 dB(A)) - There would be up to 96 sensitive receivers expected to receive noise impacts from construction works undertaken outside standard construction hours. Of these receivers: 21 receivers are within the Highly Intrusive NCA1 14 receivers are within the Moderately Intrusive NCA2 23 receivers are within the Clearly Audible NCA3 38 receivers are within the Noticeable NCA4 - The noise assessment have been determined based off the noisiest plant operation with clear line of sight to the receiver. The assessment does not take into consideration existing intervening vegetation, structures, and topography. This provides a worst-case scenario with actual noise impacts expected to be lower than those identified. - The duration of the proposed works would be approximately 6 – 12 weeks, and as such the noise impacts would be temporary and within the specified construction hours. - As such, with the implementation of appropriate safeguards and mitigation measures outlined, the potential noise impacts due to the proposed works would be low.		
Landscape character and visual amenity	- There would be a small impact to landscape character or visual amenity as a result of the proposed works. This would be temporary and limited to the construction period and would not have any lasting impacts on landscape character or visual amenity following the completion of works. - As such, the potential impacts to landscape character and visual amenity as a result of the proposed works would be low.	Section 3.7	N
Air quality and climate	The potential impact from emissions is expected to be low given the works are not in a high-density	Section 3.8	N

Environmental factor	Potential impacts	Relevant Section	Need for further assessment? (Y/N)
	residential area and areas of exposed soil would be limited. Any residual impacts from emissions would be managed with the appropriate implementation of safeguards listed - The proposed works will be for a limited time, and there would be no operational sources of greenhouse gasses arising from the proposed works. - As such, the potential impacts to air quality and climate as a result of the proposed works would be low.		
Traffic and transport	- The proposed works may have minor impacts on traffic during construction and the delivery of plant equipment, but the proposal would not permanently alter any existing traffic arrangements during operation. Any impacts would be mitigated by the implementation of the safeguards and mitigation measures listed. - As such, the potential impacts to traffic and transport as a result of the proposed works would be low.	Section 3.9	N
Socio-economic	- There may be some temporary traffic, including pedestrian traffic) disruptions on Corbie Hill Road when construction works are required within the road corridor. There would be no permanent impacts on pedestrian movements. - As such, the potential impacts to socio-economic matters as a result of the proposed works would be low.	Section 3.10	N
Waste	- The main waste streams would include small amounts of asphalt and road base, excess soil and excavated material, and small amounts of construction piping material. - No contaminated waste material and/or the removal of asbestos containing material is likely - As such, the potential impacts to waste as a result of the proposed works would be negligible.	Section 3.11	N

Environmental factor	Potential impacts	Relevant Section	Need for further assessment? (Y/N)
Cumulative impacts	- A search of the Leeton Shire Council Development Applicant tracker and a search of the NSW Major Project Portal on the 18 June 2025 found no other projects or developments in the wider locality which would add to potential impacts arising from this proposed works. - There is the potential that the proposed works in other areas of the broader UCP project would be undertaken concurrently with the proposed works for EA12. While this may constitute some cumulative impacts in relation to traffic and social, the works would be completed over a small timeframe of approximately 6 - 12 weeks. Therefore, the cumulative impacts are expected to be low. - As such, the potential cumulative impacts as a result of the proposed works would be low.	Section 3.12	N

5.1. Need for further assessment?

It should be noted that unless the mitigation measures provided in relation to the potential TEC associated with PCT 82, further detailed assessment would be required to ensure that no significant impact would occur. This would most likely take the form a standalone BA with potential offsets required.

In considering the proposed works, this assessment has examined and taken into account to the fullest extent possible, all matters affecting or likely to affect the environment by reason of that activity as addressed in the MWREF and associated information. At this stage, no further assessment of any of the identified environmental factors is considered warranted while adhering to all proposed safeguards and mitigation measures.

6. Conclusion

6.1. Justification for the proposed works

While the proposed works would potentially have some environmental impacts, the existing environmental values are well understood, and any potential impact can be ameliorated satisfactorily. It is considered that the proposed works are considered justifiable and acceptable for achieving the objectives of the works through:

- Significantly increasing customer service levels and system capacity
- Increasing regional productivity through water use efficiency
- Providing further security of water supply to towns and industry
- Investing in regional communities through local contractors
- Enhancing socio-economic outcomes by supplying water for urban green spaces, as well as providing the opportunity for local councils to deliver improved infrastructure
- A reduction in mosquito borne diseases
- Enhanced road safety
- Providing water recovery for the Murray Darling Basin through improved water use
- Investment in infrastructure that provides:
 - longer-term outcomes
 - multiple benefits
 - water recovery for the environment
- Underpinning long-term, climate change resilient primary production

6.2. Overall conclusion

This MWREF has been prepared for MI, to assess the construction and operational environmental impacts of the proposed UCP works. The proposed works for EA12 include 2.69km of new pipeline 290m to retain-as-is and 1.7km of channel to be decommissioned.

This MWREF has been prepared according to the requirements of Part 5 of the EP&A Act, specifying a “duty to consider environmental impact”. It provides a full analysis of all environmental, economic, physical and social implications of the proposal.

The key environmental risks of the works have been identified as biodiversity, Aboriginal heritage and noise and vibration. A range of safeguards have been developed for the potential impacts identified. These would ensure that the negative impacts of the proposed works are avoided, mitigated or minimised as far as practical. With the effective implementation of the safeguards listed in this MWREF the potential impacts of the proposal are considered acceptable and justified and unlikely to generate a significant adverse impact.

7. Certification, review and decision

This minor works REF provides a true and fair review of the proposal in relation to its potential effects on the environment. It addresses, to the fullest extent possible, all matters affecting or likely to affect the environment as a result of the proposal.

Appendix B Construction Methodology Types

Summary: Murrumbidgee Irrigation UCP Project is undertaking piping and rationalisation of urban channels, funded as eligible activities under the Resilient Rivers Water Infrastructure Program and will deliver 2,541 ML of Water Entitlement for the environment. The project involves replacing approximately 50 km of aging concrete and earthen urban supply channels in and adjacent to existing channels, as well as 1.4 km of leaking pipeline, with new pipelines. The project also includes rationalisation of 33 escapes, removing and replacing approx. 500 customer outlets, 2 new pump stations, road and rail crossings and a reconfiguration of the network creating greater water delivery efficiency.

Purpose: Outline approach to the MI UCP Project construction methods for the purpose of guiding the Environmental Planning & Approval Consultants in the desktop assessment. Specifically helping the environmental consultants to determine the extent of disturbance that will take place during the project.

Types of Construction:

1. New pipeline - to be constructed within the specified new alignment.
2. Convert existing channels to new pipeline - new pipeline to be constructed within or beside the existing channel;
3. Remove and/or decommission existing channel - remove concrete channel and backfill channel to natural ground level.
4. Install new drainage channel - construct new channel at a single location - Yenda.
5. Retain-as-is, no construction.
6. Underboring to be utilised in sensitive areas where surface access is unavailable.

Construction Type 1 - New Pipeline

TYPE	DESCRIPTION
ZONE A	BEDDING - BEDDING SAND PARTICLE SIZE AND GRADING LIMITS AS PER AS2566.2 APPENDIX G. COMPACT TO A DENSITY INDEX OF AT LEAST 80% IN NON-TRAFFICABLE AREAS AND 70% IN TRAFFICABLE AREAS. REFER TO NOTE 6.
ZONE B	SIDE SUPPORT AND OVERLAY - MATERIAL AND COMPACTION REQUIREMENTS EQUAL TO BEDDING.
ZONE C	NORMAL BACKFILL - TRENCH SPOIL FREE OF STONES LARGER THAN 100mm, COMPACTED TO AT LEAST 95% STANDARD MAXIMUM DRY DENSITY RATIO IN ROAD VERGES AND 90% ELSEWHERE. LIFT THICKNESS AS PER NOTE 6.
ZONE D	TOP SOIL - SURFACE LAYER OF SOIL CONTAINING ORGANIC MATTER PREVIOUSLY STRIPPED PRIOR TO TRENCHING. UNCOMPACTED.
ZONE E	GRAVEL BACKFILL - CRUSHED ROCK CLASS 2 SUB-BASE MATERIAL WITH PLASTICITY INDEX LESS THAN 12, 100% PASSING 19 SIEVE AND 6-20% 0.075 SIEVE. COMPACTED TO AT LEAST 95% STANDARD MAXIMUM DRY DENSITY RATIO IN LAYERS NOT EXCEEDING 300.
PAVEMENT	PAVEMENTS FOR ROADS, TRACKS, FOOTPATHS OR DRIVEWAYS EITHER EXISTING (TO BE REINSTATED) OR PROPOSED. PAVEMENT REINSTATEMENT TO MATCH EXISTING CONDITION APPEARANCE AND FUNCTIONALITY OR BETTER.

Construction Type 2 - Convert Existing Channel to New Pipeline

Construction Type 3 - Remove and/or Decommission Existing Channel

Construction Type 4 - Install New Drainage Channel

A new drainage channel is to be constructed at Yenda. A pipeline for this drainage channel is to be constructed by digging the earth through farmers channel and pipework as per the Construction Type 1 mentioned above. The excavation depths to which the drain is going to be constructed depends on the design outcome. This drainage pipeline runs west from the end of lateral 89 into MI's existing drainage next to Twigg Road.

Construction Type 5 - Retain-as-is

Retain existing pipeline.

Construction Type 5 - Underboring

Underboring to be utilised in sensitive areas where surface access is unavailable and/or impacts being avoided.

General Notes:

For the construction types from 1 to 4 the machinery used would be excavators of varying sizes as per the location which governs the allowable or practical size of excavators that can be used.

HDPE welding machines shall be used for different welding sizes. Pipes would be strung and welded. The welded pipes are then lowered into the excavated trenches. Bedding material shall be laid before the pipe is laid at the bottom of the pit. Where we have outlets and other fittings like valves, air valves, isolation valves involved Tee's or specific will be welded on to the pipe as per the design specifications.

All the pipelines to be constructed will run across different roads. These will be sleeved into existing MI's culverts if the design allows. New envelopers or other sleeving materials are to be constructed if the design does not allow to use the existing culvert infrastructure. There are two rail crossings where the pipelines must be sleeved or constructed in a different way if design does not allow using existing culverts under these rail lines.

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	5
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	None
Listed Threatened Ecological Communities:	5
Listed Threatened Species:	43
Listed Migratory Species:	18

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	13
Commonwealth Heritage Places:	None
Listed Marine Species:	30
Whales and Other Cetaceans:	None
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	1
Regional Forest Agreements:	None
Nationally Important Wetlands:	2
EPBC Act Referrals:	5
Key Ecological Features (Marine):	None
Biologically Important Areas:	None
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Wetlands of International Importance (Ramsar Wetlands)		[Resource Information]
Ramsar Site Name	Proximity	Buffer Status
Banrock station wetland complex	500 - 600km upstream from Ramsar site	In feature area
Fivebough and tuckerbil swamps	Within Ramsar site	In feature area
Hattah-kulkyne lakes	300 - 400km upstream from Ramsar site	In feature area
Riverland	400 - 500km upstream from Ramsar site	In feature area
The coorong, and lakes alexandrina and albert wetland	600 - 700km upstream from Ramsar site	In feature area

Listed Threatened Ecological Communities

[Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text	Buffer Status
Buloke Woodlands of the Riverina and Murray-Darling Depression Bioregions	Endangered	Community may occur within area	In feature area
Grey Box (Eucalyptus microcarpa) Grassy Woodlands and Derived Native Grasslands of South-eastern Australia	Endangered	Community likely to occur within area	In feature area
Poplar Box Grassy Woodland on Alluvial Plains	Endangered	Community may occur within area	In feature area
Weeping Myall Woodlands	Endangered	Community likely to occur within area	In feature area
White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland	Critically Endangered	Community likely to occur within area	In feature area

Listed Threatened Species

[Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text	Buffer Status
BIRD			
Aphelocephala leucopsis Southern Whiteface [529]	Vulnerable	Species or species habitat known to occur within area	In feature area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Species or species habitat known to occur within area	In feature area
Botaurus poiciloptilus Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area	In feature area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area	In feature area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Calyptorhynchus lathami lathami South-eastern Glossy Black-Cockatoo [67036]	Vulnerable	Species or species habitat known to occur within area	In feature area
Climacteris picumnus victoriae Brown Treecreeper (south-eastern) [67062]	Vulnerable	Species or species habitat may occur within area	In feature area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat known to occur within area	In feature area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area	In feature area
Grantiella picta Painted Honeyeater [470]	Vulnerable	Species or species habitat known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat may occur within area	In feature area
Leipoa ocellata Malleefowl [934]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat may occur within area	In feature area
Limosa limosa Black-tailed Godwit [845]	Endangered	Species or species habitat known to occur within area	In feature area
Lophochroa leadbeateri leadbeateri Major Mitchell's Cockatoo (eastern), Eastern Major Mitchell's Cockatoo, Pink Cockatoo (eastern) [82926]	Endangered	Species or species habitat known to occur within area	In feature area
Melanodryas cucullata cucullata South-eastern Hooded Robin, Hooded Robin (south-eastern) [67093]	Endangered	Species or species habitat known to occur within area	In feature area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area	In feature area
Pedionomus torquatus Plains-wanderer [906]	Critically Endangered	Species or species habitat likely to occur within area	In feature area
Polytelis swainsonii Superb Parrot [738]	Vulnerable	Species or species habitat known to occur within area	In feature area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area	In feature area
Stagonopleura guttata Diamond Firetail [59398]	Vulnerable	Species or species habitat known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area	In feature area
FISH			
Bidyanus bidyanus Silver Perch, Bidyan [76155]	Endangered	Species or species habitat known to occur within area	In feature area
Craterocephalus fluviatilis Murray Hardyhead [56791]	Endangered	Species or species habitat may occur within area	In buffer area only
Galaxias rostratus Flathead Galaxias, Beaked Minnow, Flat-headed Galaxias, Flat-headed Jollytail, Flat-headed Minnow [84745]	Critically Endangered	Species or species habitat may occur within area	In feature area
Maccullochella macquariensis Trout Cod [26171]	Endangered	Species or species habitat known to occur within area	In buffer area only
Maccullochella peelii Murray Cod [66633]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Macquaria australasica Macquarie Perch [66632]	Endangered	Species or species habitat may occur within area	In feature area
FROG			
Crinia sloanei Sloane's Froglet [59151]	Endangered	Species or species habitat may occur within area	In feature area
Litoria raniformis Southern Bell Frog, Growling Grass Frog, Green and Golden Frog, Warty Swamp Frog, Golden Bell Frog [1828]	Vulnerable	Species or species habitat likely to occur within area	In feature area
MAMMAL			
Nyctophilus corbeni Corben's Long-eared Bat, South-eastern Long-eared Bat [83395]	Vulnerable	Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Phascolarctos cinereus (combined populations of Qld, NSW and the ACT)			
Koala (combined populations of Queensland, New South Wales and the Australian Capital Territory) [85104]	Endangered	Species or species habitat known to occur within area	In feature area
Pteropus poliocephalus			
Grey-headed Flying-fox [186]	Vulnerable	Foraging, feeding or related behaviour may occur within area	In feature area
PLANT			
Austrostipa wakoolica			
[66623]	Endangered	Species or species habitat may occur within area	In feature area
Brachyscome papillosa			
Mossgiel Daisy [6625]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Caladenia arenaria			
Sand-hill Spider-orchid [9275]	Endangered	Species or species habitat may occur within area	In feature area
Lepidium aschersonii			
Spiny Peppercress [10976]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Lepidium monoplocoides			
Winged Pepper-cress [9190]	Endangered	Species or species habitat likely to occur within area	In feature area
Sclerolaena napiformis			
Turnip Copperburr [11742]	Endangered	Species or species habitat may occur within area	In feature area
Swainsona murrayana			
Slender Darling-pea, Slender Swainson, Murray Swainson-pea [6765]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Swainsona plagiotropis			
Red Darling-pea, Red Swainson-pea [10804]	Vulnerable	Species or species habitat may occur within area	In feature area
REPTILE			

Scientific Name	Threatened Category	Presence Text	Buffer Status
Aprasia parapulchella Pink-tailed Worm-lizard, Pink-tailed Legless Lizard [1665]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Hemiaspis damelii Grey Snake [1179]	Endangered	Species or species habitat may occur within area	In feature area

Listed Migratory Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text	Buffer Status
Migratory Marine Birds			
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area	In feature area

Migratory Terrestrial Species			
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area	In feature area

Migratory Wetlands Species			
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat may occur within area	In feature area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Species or species habitat known to occur within area	In feature area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area	In feature area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area	In feature area
Calidris pugnax as Philomachus pugnax Ruff [91256]		Species or species habitat known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Calidris ruficollis Red-necked Stint [860]		Species or species habitat known to occur within area	In feature area
Calidris subminuta Long-toed Stint [861]		Species or species habitat known to occur within area	In feature area
Charadrius bicinctus Double-banded Plover [895]		Species or species habitat known to occur within area	In feature area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area	In feature area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area	In feature area
Limosa limosa Black-tailed Godwit [845]	Endangered	Species or species habitat known to occur within area	In feature area
Pluvialis fulva Pacific Golden Plover [25545]		Species or species habitat known to occur within area	In feature area
Tringa glareola Wood Sandpiper [829]		Species or species habitat known to occur within area	In feature area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area	In feature area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Species or species habitat known to occur within area	In feature area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State	Buffer Status
Commonwealth Bank of Australia		
Commonwealth Land - Commonwealth Bank of Australia [15392]	NSW	In feature area
Commonwealth Land - Commonwealth Bank of Australia [15393]	NSW	In feature area
Commonwealth Land - Commonwealth Bank of Australia [15390]	NSW	In feature area
Commonwealth Land - Commonwealth Bank of Australia [15391]	NSW	In feature area

Communications, Information Technology and the Arts - Telstra Corporation Limited		
Commonwealth Land - Australian Telecommunications Commission [15397]	NSW	In buffer area only
Commonwealth Land - Australian Telecommunications Commission [15394]	NSW	In feature area

INDIGO Marine Cable Route Survey (INDIGO)	2017/7996	Not Controlled Action (Particular Manner)	Post-Approval	In feature area

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Biodiversity Values Map and Threshold Report

This report is generated using the Biodiversity Values Map and Threshold (BMAT) tool. The BMAT tool is used by proponents to supply evidence to your local council to determine whether or not a Biodiversity Development Assessment Report (BDAR) is required under [the Biodiversity Conservation Regulation 2017 \(Cl. 7.2 & 7.3\)](#).

The report provides results for the proposed development footprint area identified by the user and displayed within the blue boundary on the map.

There are two pathways for determining whether a BDAR is required for the proposed development:

1. Is there Biodiversity Values Mapping?
2. Is the 'clearing of native vegetation area threshold' exceeded?

Biodiversity Values Map and Threshold Report

Date of Report Generation		02/07/2025 2:33 PM
1. Biodiversity Values (BV) Map - Results Summary (Biodiversity Conservation Regulation Section 7.3)		
1.1	Does the development Footprint intersect with BV mapping?	no
1.2	Was <u>ALL</u> BV Mapping within the development footprint added in the last 90 days? (dark purple mapping only, no light purple mapping present)	no
1.3	Date of expiry of dark purple 90 day mapping	N/A
1.4	Is the Biodiversity Values Map threshold exceeded?	no
2. Area Clearing Threshold - Results Summary (Biodiversity Conservation Regulation Section 7.2)		
2.1	Size of the development or clearing footprint	740,103.2 sqm
2.2	Native Vegetation Area Clearing Estimate (NVACE) (within development/clearing footprint)	392,423.5 sqm
2.3	Method for determining Minimum Lot Size	LEP
2.4	Minimum Lot Size (10,000sqm = 1ha)	4,000 sqm
2.5	Area Clearing Threshold (10,000sqm = 1ha)	2,500 sqm
2.6	Does the estimate exceed the Area Clearing Threshold? (NVACE results are an estimate and can be reviewed using the Guidance)	yes
REPORT RESULT: Is the Biodiversity Offset Scheme (BOS) Threshold exceeded for the proposed development footprint area? (Your local council will determine if a BDAR is required)		yes

What do I do with this report?

- If the result above indicates the BOS Threshold has been exceeded, your local council may require a Biodiversity Development Assessment Report with your development application. Seek further advice from Council. An accredited assessor can apply the Biodiversity Assessment Method and prepare a BDAR for you. For a list of accredited assessors go to: <https://customer.lmbc.nsw.gov.au/assessment/AccreditedAssessor>.
- If the result above indicates the BOS Threshold has not been exceeded, you may not require a Biodiversity Development Assessment Report. This BMAT report can be provided to Council to support your development application. Council can advise how the area clearing threshold results should be considered. Council will review these results and make a determination if a BDAR is required. Council may ask you to review the area clearing threshold results. You may also be required to assess whether the development is “likely to significantly affect threatened species” as determined under the test in Section 7.3 of the *Biodiversity Conservation Act 2016*.
- If a BDAR is not required by Council, you may still require a permit to clear vegetation from your local council.
- If all Biodiversity Values mapping within your development footprint was less than 90 days old, i.e. areas are displayed as dark purple on the BV map, a BDAR may not be required if your Development Application is submitted within that 90 day period. Any BV mapping less than 90 days old on this report will expire on the date provided in Line item 1.3 above.

For more detailed advice about actions required, refer to the Interpreting the evaluation report section of the [Biodiversity Values Map Threshold Tool User Guide](#) .

Review Options:

- If you believe the Biodiversity Values mapping is incorrect please refer to our [BV Map Review webpage](#) for further information.
- If you or Council disagree with the area clearing threshold estimate results from the NVACE in Line Item 2.6 above (i.e. area of Native Vegetation within the Development footprint proposed to be cleared), review the results using the [Guide for reviewing area clearing threshold results from the BMAT Tool](#).

Acknowledgement

I, as the applicant for this development, submit that I have correctly depicted the area that will be impacted or likely to be impacted as a result of the proposed development.

Biodiversity Values Map and Threshold Tool

The Biodiversity Values (BV) Map and Threshold Tool identifies land with high biodiversity value, particularly sensitive to impacts from development and clearing.

The BV map forms part of the Biodiversity Offsets Scheme threshold, which is one of the factors for determining whether the Scheme applies to a clearing or development proposal. You have used the Threshold Tool in the map viewer to generate this BV Threshold Report for your nominated area. This report calculates results for your proposed development footprint and indicates whether Council may require you to engage an accredited assessor to prepare a Biodiversity Development Assessment Report (BDAR) for your development.

This report may be used as evidence for development applications submitted to councils. You may also use this report when considering native vegetation clearing under the State Environmental Planning Policy (Biodiversity and Conservation) 2021 - Chapter 2 vegetation in non-rural areas.

What's new? For more information about the latest updates to the Biodiversity Values Map and Threshold Tool go to the updates section on the [Biodiversity Values Map webpage](#).

Map Review: Landholders can request a review of the BV Map where they consider there is an error in the mapping on their property. For more information about the map review process and an application form for a review go to the [Biodiversity Values Map Review webpage](#).

If you need help using this map tool see our [Biodiversity Values Map and Threshold Tool User Guide](#) or contact the Map Review Team at map.review@environment.nsw.gov.au or on 1800 001 490.

Priority weeds for the Riverina

Note: this region includes the local council areas of Bland, Carrathool (lower), Coolamon, Cootamundra-Gundagai, Griffith, Hay (lower), Hilltops (western), Junee, Leeton, Lockhart Shire Council, Murrumbidgee (upper), Narrandera, Snowy Valleys (upper), Temora and Wagga Wagga.

[Select another region](#)

Weed	Duty
All plants	General Biosecurity Duty <i>All pest plants are regulated with a general biosecurity duty to prevent, eliminate or minimise any biosecurity risk they may pose. Any person who deals with any plant, who knows (or ought to know) of any biosecurity risk, has a duty to ensure the risk is prevented, eliminated or minimised, so far as is reasonably practicable.</i>
<u>Aaron's beard prickly pear</u> <i>Opuntia leucotricha</i>	Prohibition on certain dealings <i>Must not be imported into the state, sold, bartered, exchanged or offered for sale.</i>
<u>African boxthorn</u> <i>Lycium ferocissimum</i>	Prohibition on certain dealings <i>Must not be imported into the state, sold, bartered, exchanged or offered for sale.</i>
<u>Alligator weed</u> <i>Alternanthera philoxeroides</i>	Prohibition on certain dealings <i>Must not be imported into the state, sold, bartered, exchanged or offered for sale.</i>
<u>Alligator weed</u> <i>Alternanthera philoxeroides</i>	Biosecurity Zone The Alligator Weed Biosecurity Zone is established for all land within the state except land in the following regions: Greater Sydney; Hunter (but only in the local government areas of City of Lake Macquarie, City of Maitland, City of Newcastle or Port Stephens). <i>Within the Biosecurity Zone this weed must be eradicated where practicable, or as much of the weed destroyed as practicable, and any remaining weed suppressed. The local control authority must be notified of any new infestations of this weed within the Biosecurity Zone</i>

Alligator weed

Alternanthera philoxeroides

Regional Recommended Measure

Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Griffith City Council has issued a General Biosecurity Direction to the entirety of Barren Box Storage and Wetland and its riparian areas. A link to the direction is above under More Information.

Anchored water hyacinth

Eichhornia azurea

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Athel pine

Tamarix aphylla

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Bellyache bush

Jatropha gossypifolia

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Bitou bush

Chrysanthemoides monilifera subsp.
rotundata

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Bitou bush

Chrysanthemoides monilifera subsp.
rotundata

Biosecurity Zone

The Bitou Bush Biosecurity Zone is established for all land within the State except land within 10 kilometres of the mean high water mark of the Pacific Ocean between Cape Byron in the north and Point Perpendicular in the south.

Within the Biosecurity Zone this weed must be eradicated where practicable, or as much of the weed destroyed as practicable, and any remaining weed suppressed. The local control authority must be notified of any new infestations of this weed within the Biosecurity Zone

Black knapweed

Centaurea x moncktonii

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Black willow

Salix nigra

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Black willow

Salix nigra

Regional Recommended Measure

Core infestation areas: Snowy Valleys Council, Cootamundra - Gundagai Regional Council, Wagga Wagga City Council.
Exclusion zone: All of Riverina except identified core infestation areas.

Within exclusion zone: Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Within core infestation area: Land managers should mitigate the risk of the plant being introduced to their land. Land managers should mitigate spread of the plant from their land. A person should not buy, sell, move, carry or release the plant into the environment. Land managers should reduce the impact of the plant on assets of high economic, environmental and/or social value.

Blackberry.

Rubus fruticosus species aggregate

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

All species in the *Rubus fruticosus* species aggregate have this requirement, except for the varieties Black Satin, Chehalem, Chester Thornless, Dirksen Thornless, Loch Ness, Murrindindi, Silvan, Smooth Stem, and Thornfree

Blind cactus

Opuntia rufida

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Boneseed

Chrysanthemoides monilifera subsp.
monilifera

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Boneseed

Chrysanthemoides monilifera subsp.
monilifera

Control Order

Boneseed Control Zone: Whole of NSW

Boneseed Control Zone (Whole of NSW): Owners and occupiers of land on which there is boneseed must notify the local control authority of new infestations; immediately destroy the plants; ensure subsequent generations are destroyed; and ensure the land is kept free of the plant. A person who deals with a carrier of boneseed must ensure the plant (and any seed and propagules) is not moved from the land; and immediately notify the local control authority of the presence of the plant.

Boxing glove cactus

Cylindropuntia fulgida var. *mamillata*

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Bridal creeper

Asparagus asparagoides

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

***this requirement also applies to the Western Cape form of bridal creeper**

Bridal veil creeper

Asparagus declinatus

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Broomrapes

Orobanche species

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

All species of Orobanche are Prohibited Matter in NSW, except Clover broomrape, Orobanche minor and Australian broomrape, Orobanche cernua var. australiana.

Brown-spined Hudson pear

Cylindropuntia tunicata

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Bunny ears cactus
Opuntia microdasys

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Cabomba
Cabomba caroliniana

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Cane cactus
Austrocylindropuntia cylindrica

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

All species in the Austrocylindropuntia genus have this requirement

Cane needle grass
Nassella hyalina

Regional Recommended Measure

Eradication zone: whole region except for the containment zone of Wagga Wagga City Council

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Cape broom
Genista monspessulana

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Cape broom
Genista monspessulana

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Cat's claw creeper
Dolichandra unguis-cati

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Chicken dance cactus
Opuntia schickendantzii

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Chilean needle grass
Nassella neesiana

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Chilean needle grass
Nassella neesiana

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Chinese violet
Asystasia gangetica

Control Order

Owners and occupiers of land on which there is Chinese violet must notify the local control authority for the area if the Chinese violet is part of a new infestation on the land, destroy all Chinese violet on the land ensuring that subsequent generations of Chinese violet are destroyed; and keep the land free of Chinese violet. A person who deals with a carrier of Chinese violet must ensure the plant (and any seed and propagules) is not moved from the land; and immediately notify the local control authority of the presence of the plant on the land, or on or in a carrier.

Climbing asparagus
Asparagus africanus

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Climbing asparagus fern
Asparagus plumosus

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Common pear
Opuntia stricta

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Coolatai grass

Hyparrhenia hirta

Regional Recommended Measure

Core infestation areas: Cootamundra - Gundagai Regional Council, Exclusion zone: All of Riverina except identified core infestation areas.

Within exclusion zone: Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Within core infestation area: Land managers should mitigate the risk of the plant being introduced to their land. Land managers should mitigate spread of the plant from their land. A person should not buy, sell, move, carry or release the plant into the environment. Land managers should reduce the impact of the plant on assets of high economic, environmental and/or social value.

Creeping pear

Opuntia humifusa

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Eurasian water milfoil

Myriophyllum spicatum

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Eve's needle cactus

Austrocylindropuntia subulata

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

All species in the Austrocylindropuntia genus have this requirement

Fireweed

Senecio madagascariensis

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Fireweed

Senecio madagascariensis

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Flax-leaf broom

Genista linifolia

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Foxtail fern

Asparagus densiflorus

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Frogbit

Limnobium laevigatum

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

All species of Limnobium are Prohibited Matter

Gamba grass

Andropogon gayanus

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Gorse

Ulex europaeus

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Gorse

Ulex europaeus

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Green cestrum

Cestrum parqui

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found.

Grey willow

Salix cinerea

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Grey willow

Salix cinerea

Regional Recommended Measure

Core infestation areas: Snowy Valleys Council, Cootamundra - Gundagai Regional Council, Wagga Wagga City Council.

Exclusion zone: All of Riverina except identified core infestation areas.

Within exclusion zone: Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Within core infestation area: Land managers should mitigate the risk of the plant being introduced to their land. Land managers should mitigate spread of the plant from their land. A person should not buy, sell, move, carry or release the plant into the environment. Land managers should reduce the impact of the plant on assets of high economic, environmental and/or social value.

Ground asparagus

Asparagus aethiopicus

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Hawkweeds - Hieraciums

Hieracium species

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

All species in the genus *Hieracium* are Prohibited Matter except for *Hieracium murorum* (wall hawkweed).

Hawkweeds - Pilosellas

Pilosella species

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

All species in the genus *Pilosella* are Prohibited Matter

Horsetails

Equisetum species

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Hudson pear

Cylindropuntia pallida

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Hydrocotyl

Hydrocotyle ranunculoides

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Hymenachne

Hymenachne amplexicaulis and hybrids

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Jumping cholla

Cylindropuntia prolifera

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

All species in the *Cylindropuntia* genus have this requirement

Karoo acacia

Vachellia karroo

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Kidney-leaf mud plantain

Heteranthera reniformis

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

King devil hawkweed

Pilosella piloselloides

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

All species in the genus *Pilosella* are Prohibited Matter

Klein's cholla

Cylindropuntia kleiniae

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

All species in the *Cylindropuntia* genus have this requirement

Kochia

Bassia scoparia

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Excluding the subspecies *trichophylla*

Koster's curse

Clidemia hirta

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Lagarosiphon

Lagarosiphon major

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Lantana

Lantana camara

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Madeira vine

Anredera cordifolia

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Mesquite

Prosopis species

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

All species in the genus *Prosopis* have this requirement

Mesquite

Prosopis species

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Mexican feather grass

Nassella tenuissima

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Miconia

Miconia species

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

All species of *Miconia* are Prohibited Matter in NSW

Mikania vine

Mikania micrantha

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

***all species in the genus *Mikania* are Prohibited Matter in NSW**

Mimosa

Mimosa pigra

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Mother-of-millions

Bryophyllum species

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Mouse-ear hawkweed

Pilosella officinarum

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

All species in the genus *Pilosella* are Prohibited Matter

Orange hawkweed

Pilosella aurantiaca

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

All species in the genus *Pilosella* are Prohibited Matter

Parkinsonia

Parkinsonia aculeata

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Parkinsonia

Parkinsonia aculeata

Control Order

Parkinsonia Control Zone: Whole of NSW

Parkinsonia Control Zone (Whole of NSW): Owners and occupiers of land on which there is parkinsonia must notify the local control authority of new infestations; immediately destroy the plants; ensure subsequent generations are destroyed; and ensure the land is kept free of the plant. A person who deals with a carrier of parkinsonia must ensure the plant (and any seed and propagules) is not moved from the land; and immediately notify the local control authority of the presence of the plant.

Parthenium weed

Parthenium hysterophorus

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Parthenium weed

Parthenium hysterophorus

Prohibition on certain dealings

The following equipment must not be imported into NSW from Queensland: grain harvesters (including the comb or front), comb trailers (including the comb or front), bins used for holding grain during harvest operations, augers or similar for moving grain, vehicles used to transport grain harvesters, support vehicles driven in paddocks during harvest operations, mineral exploration drilling rigs and vehicles used to transport those rigs, unless set out as an exception in Division 5, Part 2 of the Biosecurity Order (Permitted Activities) 2017

Pencil cactus

Cylindropuntia leptocaulis

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

All species in the *Cylindropuntia* genus have this requirement

Perennial ground cherry

Physalis longifolia

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Pond apple

Annona glabra

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Prairie ground cherry

Physalis hederifolia

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Prickly acacia

Vachellia nilotica

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Prickly pears - *Austrocylindropuntias*

Austrocylindropuntia species

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

All species in the *Austrocylindropuntia* genus have this requirement

Prickly pears - Cylindropuntias

Cylindropuntia species

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

All species in the *Cylindropuntia* genus have this requirement

Prickly pears - Opuntias

Opuntia species

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

For all *Opuntia* species except for *Opuntia ficus-indica* (Indian fig).

Ragwort

Senecio jacobaea

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Riverina pear

Opuntia elata

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Rope pear

Cylindropuntia imbricata

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

All species in the *Cylindropuntia* genus have this requirement.

Rubber vine

Cryptostegia grandiflora

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Sagittaria

Sagittaria platyphylla

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Sagittaria

Sagittaria platyphylla

Regional Recommended Measure

Eradication whole of region except for Griffith.

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Salvinia

Salvinia molesta

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Salvinia

Salvinia molesta

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Scotch broom

Cytisus scoparius subsp. *scoparius*

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Scotch broom

Cytisus scoparius subsp. *scoparius*

Regional Recommended Measure

Core infestation areas: Snowy Valleys Council. Exclusion zone: All of Riverina except identified core infestation areas. *Within exclusion zone: Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Within core infestation area: Land managers should mitigate the risk of the plant being introduced to their land. Land managers should mitigate spread of the plant from their land. A person should not buy, sell, move, carry or release the plant into the environment. Land managers should reduce the impact of the plant on assets of high economic, environmental and/or social value.*

Senegal tea plant

Gymnocoronis spilanthoides

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Serrated tussock

Nassella trichotoma

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Serrated tussock

Nassella trichotoma

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Siam weed

Chromolaena odorata

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Silverleaf nightshade

Solanum elaeagnifolium

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Smooth tree pear

Opuntia monacantha

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Snake cactus

Cylindropuntia spinosior

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

All species in the *Cylindropuntia* genus have this requirement

Snakefeather

Asparagus scandens

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Spongeplant

Limnobia spongia

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

All species of *Limnobia* are Prohibited Matter

Spotted knapweed

Centaurea stoebe subsp. *micranthos*

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Tiger pear

Opuntia aurantiaca

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Tropical soda apple

Solanum viarum

Control Order

Tropical Soda Apple Control Zone: Whole of NSW

Tropical Soda Apple Control Zone (Whole of NSW): Owners and occupiers of land on which there is tropical soda apple must notify the local control authority of new infestations; destroy the plants including the fruit; ensure subsequent generations are destroyed; and ensure the land is kept free of the plant. A person who deals with a carrier of tropical soda apple must ensure the plant (and any seed and propagules) is not moved from the land; and immediately notify the local control authority of the presence of the plant on the land, or on or in a carrier.

Velvety tree pear

Opuntia tomentosa

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Water caltrop

Trapa species

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

All species in the *Trapa* genus are Prohibited Matter in NSW

Water hyacinth

Eichhornia crassipes

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Water hyacinth

Eichhornia crassipes

Biosecurity Zone

The Water Hyacinth Biosecurity Zone applies to all land within the State, except for the following regions: Greater Sydney or North Coast, North West (but only the local government area of Moree Plains), Hunter (but only in the local government areas of City of Cessnock, City of Lake Macquarie, MidCoast, City of Maitland, City of Newcastle or Port Stephens), South East (but only in the local government areas of Eurobodalla, Kiama, City of Shellharbour, City of Shoalhaven or City of Wollongong).

Within the Biosecurity Zone this weed must be eradicated where practicable, or as much of the weed destroyed as practicable, and any remaining weed suppressed. The local control authority must be notified of any new infestations of this weed within the Biosecurity Zone

Water lettuce

Pistia stratiotes

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Water poppy

Hydrocleys nymphoides

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

Water soldier

Stratiotes aloides

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Wheel cactus

Opuntia robusta

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

Willows

Salix species

Prohibition on certain dealings

Must not be imported into the state, sold, bartered, exchanged or offered for sale.

All species in the *Salix* genus have this requirement, except *Salix babylonica* (weeping willows), *Salix x calodendron* (pussy willow) and *Salix x reichardtii* (sterile pussy willow)

Witchweeds

Striga species

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

All species in the *Striga* genus are Prohibited Matter in NSW, except the native *Striga parviflora*

Yellow burrhead

Limncharis flava

Prohibited Matter

A person who deals with prohibited matter or a carrier of prohibited matter is guilty of an offence. A person who becomes aware of or suspects the presence of prohibited matter must immediately notify the Department of Primary Industries

Yellow waterlily

Nymphaea mexicana

Regional Recommended Measure

Land managers should mitigate the risk of the plant being introduced to their land. Land managers should eradicate the plant from the land and keep the land free of the plant. A person should not deal with the plant, where dealings include but are not limited to buying, selling, growing, moving, carrying or releasing the plant. Notify local control authority if found. Your local biosecurity weeds officer can help to identify, advise on control, and how to remove this weed.

The content provided here is for information purposes only and is taken from the *Biosecurity Act 2015* and its subordinate legislation, and the Regional Strategic Weed Management Plans (published by each Local Land Services region in NSW). It describes the state and regional priorities for weeds in New South Wales, Australia.

Appendix E Construction Noise Estimator Tool (CNET)

Distanced Based Assessment (Noisiest Plant)

Steps for Assessment:

1. Schedule noisy works to occur in standard hours where possible or before 11pm and implement Standard Measures.
 2. Select the representative noise area category. The worksheet titled 'Representative Noise Environ.' provides a number of examples to help select the noise area category.
 3. Select the noisiest plant. If not found in drop-down list, refer to 'Source List' and select a representative plant with equivalent sound power level.
 4. Is there line of sight to receiver? Select the appropriate scenario from the drop down list.
Identify and implement standard mitigation measures where feasible and reasonable. Include any shielding implemented as part of the standard mitigation measures by changing the selection in the 'Is there line of sight to receiver' drop-down list. Solid barriers can be in the form of road cutting, timber lapped and capped fence, shipping container, site office, etc. Substantial solid barriers are barriers greater than 5 metres in height or multiple rows of houses or a sound barrier specifically designed to mitigate construction noise. Please note that vegetation and trees are not considered to be a form of solid barrier and any gaps would compromise the acoustic integrity of the solid barrier.
 5. Determine if there are any receivers (both residential and non-residential receivers) within the affected distance for each relevant time period. Consider background LA90 noise measurements to check assumption in Step #2 if:
(a) there are many affected receivers and the impact duration at any one receiver is more than 3 weeks; or
(b) there are a few affected receivers and the impact duration at any one receiver is more than 6 weeks.
Note that consideration needs to be given to the construction staging plan when determining impact duration.
 7. Identify if there are any receivers within the additional mitigation measures distances and identify feasible and reasonable measures at each receiver.
 8. Where night works are involved, identify sleep disturbance affected distance.
 9. Document the outcomes of these steps.
- (Note that suitable noise management levels for other noise-sensitive businesses not identified in the Construction and Maintenance Noise Estimator should be investigated on a project-by-project basis. Please contact a Transport for NSW noise specialist for more information)

Abbreviation	Measure
N	Notification
SN	Specific notifications
PC	Phone calls
IB	Individual briefings
RO	Respite offer
R1	Respite period 1
R2	Respite period 2
DR	Duration respite
AA	Alternative accommodation
V	Verification

Note that spot check verification of noise levels and individual briefings are not required for projects with less than 3 weeks impact duration

Please pick from drop-down list in orange cells

To whom it may concern,

RE: Murrumbidgee Irrigation Urban Channels Pipeline (UCP) Project

Murrumbidgee Irrigation (MI) is one of the largest private irrigation companies in Australia. Located within the Murray-Darling Basin in southern central NSW, MI services over 3,093 landholdings, owned by over 2,300 shareholder customers within an area of 378,911 hectares. MI's core business is the delivery of water through an extensive integrated supply and drainage network.

The Murrumbidgee Irrigation Urban Channels Pipeline (UCP) Project is proposing to undertake piping and rationalisation of urban channels, funded as eligible activities under the Resilient Rivers Water Infrastructure Program and will deliver 2,541ML of Water Entitlement for the environment. The project involves replacing approximately 50 kilometres (km) of aging concrete and earthen urban supply channels in and adjacent to existing channels, as well as 1.4km of leaking pipeline, with new pipelines. The project also includes rationalisation of 33 escapes, removing and replacing approximately 500 customer outlets, 2 new pump stations, road and rail crossings and a reconfiguration of the network creating greater water delivery efficiency.

MI has engaged NGH to prepare an environmental assessment for the proposed works, which would be completed in the form of Minor Works Review of Environmental Factors (MWREF). The MWREF will be completed in accordance with Division 5.1 of the *Environmental Planning and Assessment Act 1979* (EP&A Act), taking into account the requirements of Section 171(2) of the Environmental Planning and Assessment Regulation 2021 (EP&A Reg) (previously Clause 228 Factors of the EP&A Regulation 2000).

The UCP Project within Leeton Shire Council (LSC) has been divided into 5 Environmental Areas (EA's) for the purpose of the planning, environmental assessments and approvals. Refer to Appendix A for LSC Environmental Assessment Areas Maps

As per Section 2.10 of the State Environmental Planning Policy (Transport and Infrastructure) 2021 (TISEPP), MI must consult with LSC as the proposed works are likely to impact council related infrastructure or services.

Table 1 LSC managed land impacted by the UCP Project and Planned Construction

Enviro Planning Areas & Laterals	Impacts on LSC managed Land	Planned Construction Year
EA9 – Leeton Lateral 63	Yes	2025
EA10 – Leeton Lateral 5, 21, 99	Yes	2025
EA11 – Leeton Lateral Other	Yes	2026
EA12 – Corbie Hill Laterals 7, 22, 23, 24	Yes	2025
EA13 – Wamoon Lateral 73	Yes	2026

Appendix B – F details the impacts to specific locations

Construction methodologies:

The construction approaches proposed are:

- New pipeline - to be constructed within the specified new alignment.
- Convert existing channels to new pipeline - new pipeline to be constructed beside the existing channel (up to 2m in depth).
- Remove and/or decommission existing channel - remove concrete channel and backfill channel to existing ground level.
- Infrastructure may also be retained as-is
- Underboring would be utilised in sensitive areas where surface access is unavailable

For all construction types, excavators of varying sizes will be used depending on the proposed works. HDPE welding machines would be employed for different welding sizes. The pipes would be strung and welded and then lowered into the excavated trenches. Before laying the pipes at the bottom of the pit, bedding material would be placed.

Where outlets and other fittings are involved, they would be welded onto the pipes according to design specifications. All pipelines to be constructed will run across

different roads and will be sleeved into existing MI culverts if the design permits. If the design does not allow the use of existing culvert infrastructure, the existing culverts would be removed, and pipe is laid by open trenching through the Council managed roads.

For the purpose of the MWREF's, all proposed work areas have had a 10m buffer applied either side of the channel/pipeline and have been assessed as 'new pipeline' to identify the worst-case scenario impacts. The final development areas are likely to be reduced in nature.

As stated above, MI is required to consult with LSC as part of the MWREF process. MI is seeking Council's comment on the proposed works in relation to the potential impact on LSC managed land.

If you have any questions, please contact Simon Jackson (simon.jackson@irrigration.com.au or 0408 201 474). We would be pleased to discuss any aspect of this project with you further.

Yours faithfully

Steven Porter

General Manager – Asset Performance and Delivery

Appendix A – LSC Environmental Areas Assessed Maps

Appendix B – Environmental Area 9 – Leeton Lateral 63

The planned works for EA9 include approximately 0.52km of UCP modifications consisting of mainly new pipeline

While the majority of the proposed works falls within land managed by MI, the proposed works also fall within the road corridor of Scarlet Street, Toorak Road and Argyle Street, identified as managed by LSC.

The proposed works are:

- Not located within mapped flood prone land
- Not located on mapped bushfire prone land
- Not located within or adjacent to local heritage areas
- Not located within land zoned C1 National Parks and Nature Reserves, or adjacent to a national park.

Appendix C – Environmental Area 10 – Leeton Lateral 5, 21, 99

The planned works for EA10 include approximately 4.46km of UCP modifications consisting of mainly new pipeline

While some areas of the proposed works fall within land managed by MI, the proposed works also fall within the following road corridors, which are identified as managed by LSC:

- Petersham Road
- Lillypilly Road
- Irrigation Way
- McQuillan Road
- Breed Road
- Jackson Road
- Merungle Hill Road

The proposed works are:

- Not located within mapped flood prone land
- Located on mapped bushfire prone land – Category 2 Vegetation
- Not located within or adjacent to local heritage areas
- Not located within land zoned C1 National Parks and Nature Reserves, or adjacent to a national park.

Appendix D – Environmental Area 11 – Leeton Lateral Other

The planned works for EA11 include approximately 22.45km of UCP modifications consisting of mainly new pipeline.

While some areas of the proposed works fall within land managed by MI, the proposed works also fall within the following road corridors, which are identified as managed by LSC:

- | | |
|-------------------|------------------|
| • Research Road | • Petersham Road |
| • Gladman Road | • Almond Road |
| • Dempsey Road | • Grevillia Road |
| • Back Yanco Road | • Diabate Road |
| • Warren Road | • Fivebough Road |
| • Earle Road | • Cassia Road |
| • Irrigation Way | • Brobenah Road |
| • Yanco Avenue | • Lonnie Road |

The proposed works are:

- Not located within mapped flood prone land
- Not located on mapped bushfire prone land
- Located adjacent to the Italian Worker Cottage heritage listed item LEP #163
- Not located within land zoned C1 National Parks and Nature Reserves, or adjacent to a national park.

Appendix E – Environmental Area 12 – Leeton Lateral 7, 22, 23, 24 Corbie Hill

The planned works for EA12 include approximately 3.57km of UCP modifications consisting of mainly new pipeline.

While the majority of the proposed works falls within land managed by MI, the proposed works also fall within the road corridor of Corbie Hill Road and Curtin Road.

The proposed works are:

- Not located within mapped flood prone land
- Not located on mapped bushfire prone land
- Not located within or adjacent to local heritage areas
- Not located within land zoned C1 National Parks and Nature Reserves, or adjacent to a national park.

Appendix F – Environmental Area 13 – Wamoon Lateral 73

The planned works for EA13 include approximately 2.37km of UCP modifications consisting of mainly new pipeline.

While some areas of the proposed works fall within land managed by MI, the proposed works also fall within the following road corridors, which are identified as managed by LSC:

- | | |
|----------------------|------------------|
| • Henry Lawson Drive | • Bourke Road |
| • Phillip Street | • Oxley Road |
| • Crowes Road | • Lachlan Street |

The proposed works are:

- Not located within mapped flood prone land
- Not located on mapped bushfire prone land
- Not located within or adjacent to local heritage areas
- Not located within land zoned C1 National Parks and Nature Reserves, or adjacent to a national park.

Appendix G Biodiversity Assessment

G.1 Test of Significance

- Southern Bell Frog (*Litoria raniformis*) – Endangered

Response
(a) whether the proposed development or activity is likely to have an adverse effect on the life cycle of the species such that a viable local population of the species is likely to be placed at risk of extinction Southern Bell Frog is usually found among vegetation within or at the edges of permanent water such as slow flowing streams, swamps, lagoons and lakes. In disturbed areas it also commonly occurs in artificial waterbodies such as farm dams, irrigation channels, irrigated rice crops and disused quarries, particularly where natural habitat is no longer available (DSE, 2012). Favoured sites frequently have a large proportion of emergent, submerged and floating vegetation, and slow-flowing or still water (Cth DCCEEW, 2024) The southern bell frog is divided into two lineages: the temperate southern lineage and the semi-arid northern lineage. The Project Area occurs in the northern part of the species range, hence, may be part of the semi-arid northern lineage, though the distribution limits for this species lineages is not yet resolved (Cth DCCEEW, 2024) Suitable habitat in the Development Footprint is aquatic habitat, consisting of open concrete irrigation channels (approximately 40cm high and 40cm wide), with limited fringing vegetation. The Southern Bell Frog breeds in the warmer months (September to April) following a rise in water levels (OEH, 2023). Mating occurs on the edge of, or within, permanent waterbodies, flooded plains, and creek pools, in areas with extensive growth of either emergent or submerged vegetation (Cth DCCEEW, 2024). Egg clusters are laid on the water surface or up to 50 cm below it and rapidly sink. The irrigation channel in the Development Footprint is unlikely to have permanence of water (still waterbody) for a duration long enough (at least four to 12 months) to allow a tadpole to fully develop into an adult, therefore, is unsuitable as breeding habitat for the Southern Bell Frog. There are no nearby water courses or waterbodies that connect with the area EA12 irrigation channels. The utilisation of this habitat by the Southern Bell Frog for breeding would also be limited by the lack of preferred vegetative cover e.g. emergent, submerged or floating plants. The proposed activity is not likely to have an adverse effect on the life cycle of this species such that a viable local population would be placed at risk of extinction
(b) in the case of an endangered ecological community or critically endangered ecological community, whether the proposed development or activity: i. is likely to have an adverse effect on the extent of the ecological community such that its local occurrence is likely to be placed at risk of extinction, or ii. is likely to substantially and adversely modify the composition of the ecological community such that its local occurrence is likely to be placed at risk of extinction

Response
n/a
(c) in relation to the habitat of a threatened species or ecological community: i. the extent to which habitat is likely to be removed or modified as a result of the proposed development or activity, and ii. whether an area of habitat is likely to become fragmented or isolated from other areas of habitat as a result of the proposed development or activity, and iii. the importance of the habitat to be removed, modified, fragmented or isolated to the long-term survival of the species or ecological community in the locality.
i. Aquatic habitat in the project area consists of approximately 226.99 ha of irrigation channel and fringing vegetation. The proposal will reduce the area of occupancy of the Southern Bell Frog by removing 226.99 ha irrigation channels. ii. The aquatic habitat in the form of irrigation channels (in area EA12) would be fragmented by the proposed works with some existing concrete and earthen irrigation channels being converted to pipelines. The replacement of the irrigation channels with pipelines would reduce available water habitat for this species, however, is unlikely to fragment an existing population due to the mobility of this species. iii. The aquatic habitat occurs in the form of an open air, shallow (approximately 40cm deep) concrete-based and earthen irrigation channel (impermeable and lacking aquatic vegetation except where concrete is damaged) with ephemeral water and fringing vegetation. These channels with limited preferred habitat provide limited breeding and foraging habitat (Cth DCCEEW, 2024). The surrounding terrestrial habitat is already disturbed with a history of agricultural use and urban development in the Project Area. There are no BioNet records of the Southern Bell Frog within the Project Area (area EA12). Irrigation channels in area EA12 do not connect to primary habitat, such as Murrumbidgee River. It is unlikely that irrigation channels are being used as dispersal/recolonisation routes between the Murrumbidgee River and other permanent water bodies. Upgrading irrigation channels to pipelines will modify, destroy, remove, isolate or decrease the availability of habitat, however, as the present irrigation channels are low quality habitat they are not considered to be important for the long-term survival of this species in the locality.
(d) whether the proposed development or activity is likely to have an adverse effect on any declared area of outstanding biodiversity value (either directly or indirectly).
The proposed development is not directly or indirectly within any areas of outstanding biodiversity value mapped land. The closest areas of mapped biodiversity value are 2.2 km north of the proposed development on a mapped RAMSAR wetland.
(e) whether the proposed development or activity is or is part of a key threatening process or is likely to increase the impact of a key threatening process.

Response
Weeds and Pests As outlined above, the habitat is already in a disturbed state and can be accessed by people, vehicles, farm animals and pest animals, with existing weed species within bordering vegetation of the irrigation channel. The proposal would not introduce or exacerbate harmful species into the area of the Southern Bell Frog habitat. Disease The Southern Bell Frog is susceptible to Chytridiomycosis, which is an infectious disease caused by amphibian chytrid fungus (<i>Batrachochytrium dendrobatidis</i>) (DSE, 2012). The fungus can be transferred through soil, therefore, there is a risk of the fungus being carried onto the site through contaminated machinery and footwear. To prevent the spread of the amphibian chytrid fungus, it is recommended that a hygiene protocol is followed. With these protocols followed, the proposal is unlikely to introduce a disease to the Project Area that would cause the Southern Bell Frog to decline. Climate change As the Southern Bell Frog is a habitat generalist, it is less likely to be impacted by effects of climate change (Cth DCCEEW, 2024). However, the effects of (chytridiomycosis caused by the chytrid fungus increases mortality rates of infected Southern Bell Frog. Climate change has the potential to exacerbate the impacts of chytridiomycosis.
Conclusion
There would be impacts to potentially suitable habitat for the Southern Bell Frog within the project area, however due to the following: • there is a lack of records indicating a lower likelihood of occupation. • concrete and earthen irrigation channels, with restricted fringing terrestrial and aquatic vegetation, provide limited breeding and foraging habitat for the Southern Bell Frog • there are no areas of important habitat in the Project Area • no important populations would be impacted. The impacts to this species are not considered to be significant.

- Superb Parrot (*Polytelis swainsonii*) – Vulnerable

Response
(a) whether the proposed development or activity is likely to have an adverse effect on the life cycle of the species such that a viable local population of the species is likely to be placed at risk of extinction

Response
The presence of <i>Polytelis swainsonii</i> in the proposed work area has been assumed based on the presence of associated PCTs and suitable habitat. There are no known records within the Proposed work area. Potential suitable habitat in the Involved Lots includes habitat consisting of woodland. <i>P. swainsonii</i> is associated with PCT 82, which was identified within the proposed work area. Within the proposed work area, less than 0.18 ha of potential woodland habitat for this species is proposed to be removed as part of the project (trimming tree branches, only if necessary). No HBTs are within the proposed work area, and therefore no breeding habitat in the form of suitable hollows are being removed (DAWE, 2022) Superb Parrot have also been observed to utilise hollows with the following hollow measurements: • Minimum entrance diameter of eight to 12 cm • Depth of 59-112 cm • Floor diameter of 15-22 cm • Branch or stem diameter of 36-49 cm (Stojanovic, et al., 2020) There are three main breeding areas for <i>P. swainsonii</i>, one of which occur within a 10 km radius of the proposed work area. In the Riverina, this species nests in loose colonies in large, living or dead trees with many hollow branches, typically near a watercourse. On the inland slopes, they use at least six species of eucalypts. They also have an assumed reliance on White Box and Yellow Box trees. Most nest sites are within 10 km of Box-Gum Woodland and are sometimes within it. After breeding, they use a variety of woodland types and other habitat types and mostly feed on the ground (Threatened Species Scientific Committee, 2016). Due to the hollow requirements of <i>P. swainsonii</i>, potential nesting and breeding habitat is absent within the proposed work area. The core breeding areas of <i>P. swainsonii</i> are found along the Murray and Edward Rivers, Murrumbidgee River and in a triangular area bounded by Molong, Yass and Young (DCCEEW, 2025). The closest core breeding area is located along the Murrumbidgee River. The Murrumbidgee River is approximately 7 km south from the proposed work area. From the Murrumbidgee River, the core breeding area includes a 10 km radius from the river. The proposed work area is therefore within the core breeding area. There are no records of this species within the proposed work area. However, within a 10 km of the proposed work area there are 7115 records (BioNet, 2025) An important population is considered to occur, as the proposed work area is within a known core breeding area, with over 7000 records within the 10 km locality (BioNet, 2025). However, because the proposed works are impacting less than 0.18 ha of foraging habitat, with no impacts to any breeding habitat, it is unlikely to have an adverse effect on the life cycle of the species such that a viable local population of the species is likely to be placed at risk of extinction
(b) in the case of an endangered ecological community or critically endangered ecological community, whether the proposed development or activity: i. is likely to have an adverse effect on the extent of the ecological community such that its local occurrence is likely to be placed at risk of extinction, or

Response
ii. is likely to substantially and adversely modify the composition of the ecological community such that its local occurrence is likely to be placed at risk of extinction
n/a
(c) in relation to the habitat of a threatened species or ecological community: i. the extent to which habitat is likely to be removed or modified as a result of the proposed development or activity, and ii. whether an area of habitat is likely to become fragmented or isolated from other areas of habitat as a result of the proposed development or activity, and iii. the importance of the habitat to be removed, modified, fragmented or isolated to the long-term survival of the species or ecological community in the locality.
i. The proposed work area contains PCT 82 <i>Western Grey Box - Poplar Box - White Cypress Pine tall woodland</i>, in restricted areas within the proposed work area (covering 0.18 ha), with the overall patch extending to a larger patch that is being avoided by the proposed works. A tree protection Zone (TPZ) will be established, with minimal impacts to vegetation proposed (trimming tree branches, only if necessary). Surrounding areas have general degradation across the area as a result of agricultural activities. ii. The proposed impacts would upgrade existing earthen irrigation channels to pipelines, with a tree protection zone established within around the PCT 82 mapped areas, with only potential to trim branches, if necessary, causing no additional fragmentation. This potential removal of branches will not fragment the patch of mapped PCT 82. Any branches that are required to be trimmed will be on the edge of the patch. As a TPZ will be established around the PCT 82 patch within the proposed work area, it is unlikely that habitat for Superb Parrot will become fragmented or isolated from other areas of habitat as a result of the proposed development or activity. iii. Superb Parrot use tree hollows for breeding habitat. Suitable nesting and breeding habitat is absent within the proposed work area. <i>P. swainsonii</i> could utilize the PCT 82 within the proposed work area for foraging. As the proposed works are likely restricted to the existing earthen pipeline, outside of trimming branches (if necessary), foraging habitat will modified, but not removed within the 0.18 ha patch of PCT 82 woodland. It is not expected to impact the long-term survival of <i>P. swainsonii</i> within the locality. Approximately 23,747 ha of woodland, shrubland and grassland foraging habitat would be retained within the locality.
(d) whether the proposed development or activity is likely to have an adverse effect on any declared area of outstanding biodiversity value (either directly or indirectly).
The proposed development is not directly or indirectly within any areas of outstanding biodiversity value mapped land. The closest areas of mapped biodiversity value are 3.1 km north of the proposed development on a mapped RAMSAR wetland (Fivebough and Tuckerbil wetland). Superb Parrot would utilise this area for foraging and as a connective corridor between known critical breeding habitat on the Murrumbidgee River.

Response
(e) whether the proposed development or activity is or is part of a key threatening process or is likely to increase the impact of a key threatening process.
Weeds and Pests As outlined above, the habitat is already in a disturbed state and can be accessed by people, vehicles, farm animals and pest animals, with existing weed species within bordering vegetation of the irrigation channel. The proposal would not introduce or exacerbate harmful species into the area of the Superb Parrot habitat. Invasive species that are harmful to <i>P. swainsonii</i> becoming established in its habitat include invasive species such as the Common Starling <i>Sturnus vulgaris</i> and the introduced Honeybee <i>Apis mellifera</i> which compete for hollows as roosting and / or breeding habitat (Threatened Species Scientific Committee, 2016). It is not predicted that the proposed action would result in an increase of the presence of these invasive species. The proposed project has the potential to contribute to the spread of invasive species, mainly through the clearing of vegetation, in addition to potential transfer and introduction of both plant material and soil on machinery. Mitigation measures have been recommended in the REF to prevent the spread of weeds throughout the project area. Additionally, <i>P. swainsonii</i> has not been recorded within the proposed work area or wider locality and therefore it is unlikely that the proposed work will result in invasive species that are harmful to <i>P. swainsonii</i> becoming established in its suitable habitat (BioNet, 2025) Disease <i>P. swainsonii</i> is at risk of Psittacine Beak and Feather Disease (PBFD), a potentially fatal disease caused by psittacine circovirus. The disease is typically transferred between adults and nestling. The ongoing loss of nest hollows is likely to intensify competition and use of nest trees and increase the transmission likelihood of the disease (Threatened Species Scientific Committee, 2016). There are no HBTs within the proposed work area, resulting in a low likelihood of increasing competition, and PBFD. There is a risk that diseases could be introduced to the proposed work area via machinery, vehicles, and materials during construction and operation. With the implementation of the recommended mitigation measures, the proposal is unlikely to result in the introduction of any disease that may cause these species to decline Climate Change Bioclimatic modelling has shown that <i>P. swainsonii</i> is likely to be impacted by effects of climate change (Threatened Species Scientific Committee, 2016). The effects of climate change are predicted to decline by around 47 percent by 2050. Generally, the predicted impacts will be higher in the western home range of the species. The future bioclimatic core range of the Superb Parrot will likely focus around the ACT and an area to the immediate north. This has implications for long-term superb parrot conservation as this area is already highly modified and other work (Manning et al., 2013) has demonstrated that nest trees are continuing to decline in this region and that, under a ‘business as usual’ scenario, are likely to decline by a further 38 percent from current levels by 2050 (Threatened Species Scientific Committee, 2016). Retaining suitable HBTs as breeding habitat is essential to reducing the potential impacts of climate change. No breeding

Response
habitat is proposed to be removed; therefore the proposed works are unlikely to increase the impact of a key threatening process.
Conclusion
The proposed development or activity is unlikely to have an adverse effect on the life cycle of the species such that a viable local population of the <i>P. swainsonii</i> is likely to be placed at risk of extinction. The proposed works are not likely to adversely affect habitat critical to the survival of the species, disrupt the breeding cycle of a population or interfere with the recovery of the species, or impact habitat significantly. The proposed development is not directly or indirectly within any areas of outstanding biodiversity value. The proposed development is unlikely to increase the impact of a key threatening processes. With standard biosecurity protocols in place, the proposed action is not likely to introduce disease that may cause the species to decline, or result in invasive species becoming established in the species' habitat. Recommended mitigation measures include: • Vehicles and machinery to be checked for soil and plant matter and washed down prior to entering the site • Brushing and cleaning boots if walking through native vegetation. Considering the above factors, the proposed action is not likely to have a significant impact on <i>Polytelis swainsonii</i>.

- Pink Cockatoo (*Lophochroa leadbeateri*) – Vulnerable

Response
(a) whether the proposed development or activity is likely to have an adverse effect on the life cycle of the species such that a viable local population of the species is likely to be placed at risk of extinction
<i>L. leadbeateri</i> is a species of parrot found across the arid and semi-arid inland, from south-western Queensland to north-west Victoria, through most of South Australia, into the south-west Northern Territory and across to the west coast between Shark Bay and Jurien. In NSW it is found regularly as far east as about Bourke and Griffith, and sporadically further east (NSW OEH, 2024). The proposed work area resides outside of the species' known or predicted distribution areas under the federal threatened species profile (DCCEEW, 2025) however is included the NSW species profile distribution (NSW OEH, 2024). <i>L. leadbeateri</i> is associated with PCT 82, found within the proposed work area. There are 798 BioNet records of the <i>L. leadbeateri</i> within 10 km of the proposed work area. <i>L. leadbeateri</i> relies on large, tall trees with large hollow dimensions for nesting. The species is known to forage on seeds of native shrubs and trees, and sometimes forages on roots, bulbs, insect larvae, seeds of crops and weeds (DCCEEW, 2023). Foraging habitat is present within the proposed work area in the form of woodland. There are no hollow-bearing trees (HBTs) within 1km of the proposed work areas. However,

Response
because the proposed works are impacting less than 0.18 ha of foraging habitat, with no impacts to any breeding habitat, it is unlikely to have an adverse effect on the life cycle of the species such that a viable local population of the species is likely to be placed at risk of extinction
(b) in the case of an endangered ecological community or critically endangered ecological community, whether the proposed development or activity: i. is likely to have an adverse effect on the extent of the ecological community such that its local occurrence is likely to be placed at risk of extinction, or ii. is likely to substantially and adversely modify the composition of the ecological community such that its local occurrence is likely to be placed at risk of extinction
n/a
(c) in relation to the habitat of a threatened species or ecological community: i. the extent to which habitat is likely to be removed or modified as a result of the proposed development or activity, and ii. whether an area of habitat is likely to become fragmented or isolated from other areas of habitat as a result of the proposed development or activity, and iii. the importance of the habitat to be removed, modified, fragmented or isolated to the long-term survival of the species or ecological community in the locality.
i. The proposed work area contains PCT 82 <i>Western Grey Box - Poplar Box - White Cypress Pine tall woodland</i>, in restricted areas within the proposed work area (covering 0.18 ha), with the overall patch extending to a larger patch that is being avoided by the proposed works. A tree protection Zone (TPZ) will be established, with minimal impacts to vegetation proposed (trimming tree branches, only if necessary). Surrounding areas have general degradation across the area as a result of agricultural activities. ii. The proposed impacts would upgrade existing earthen irrigation channels to pipelines, with a tree protection zone established within around the PCT 82 mapped areas, with only potential to trim branches, if necessary, causing no additional fragmentation. This potential removal of branches will not fragment the patch of mapped PCT 82. Any branches that are required to be trimmed will be on the edge of the patch. As a TPZ will be established around the PCT 82 patch within the proposed work area, it is unlikely that habitat for Superb Parrot will become fragmented or isolated from other areas of habitat as a result of the proposed development or activity. iii. Pink Cockatoo use tree hollows for breeding habitat. Suitable nesting and breeding habitat is absent within the proposed work area. <i>L. leadbeateri</i> could utilize the PCT 82 within the proposed work area for foraging. As the proposed works are likely restricted to the existing earthen pipeline, outside of trimming branches (if necessary), foraging habitat will modified but not removed within the 0.18 ha patch of PCT 82 woodland. It is not expected to impact the long-term survival of <i>L. leadbeateri</i> within

Response
the locality. Approximately 23,747 ha of woodland, shrubland and grassland foraging habitat would be retained within the locality
(d) whether the proposed development or activity is likely to have an adverse effect on any declared area of outstanding biodiversity value (either directly or indirectly)
The proposed development is not directly or indirectly within any areas of outstanding biodiversity value mapped land. The closest areas of mapped biodiversity value are 3.1 km north of the proposed development on a mapped RAMSAR wetland (Fivebough and Tuckerbil wetland). Pink Cockatoo would utilise these wetlands for foraging and as a connective corridor between breeding habitat
(e) whether the proposed development or activity is or is part of a key threatening process or is likely to increase the impact of a key threatening process
Weeds and Pests As outlined above, the habitat is already in a disturbed state and can be accessed by people, vehicles, farm animals and pest animals, with existing weed species within bordering vegetation of the irrigation channel. The proposal would not introduce or exacerbate harmful species into the area of the Pink Cockatoo habitat. Disease <i>L. leadbeateri</i> is at risk of Psittacine Beak and Feather Disease (PBFD), a potentially fatal disease caused by psittacine circovirus. This is typically transferred between adults, nestlings and contaminated nest hollows, with most positive cases recorded in the eastern subspecies (DCCEEW, 2023) There is a risk that diseases could be introduced to the proposed work area via machinery, vehicles, and materials during clearing, construction and operation. With the implementation of the recommended mitigation measures, the proposal is unlikely to result in the introduction of any disease that may cause the species to decline. Climate change Changing rainfall patterns and increased heatwaves and droughts would severely affect <i>L. leadbeateri</i> and their habitat. Prolonged and severe drought could reduce the extent of the tall semi-arid woodland and reduce the availability of fresh water across <i>L. leadbeateri</i> range (Cth DCCEEW, 2023). The proposed impact of trimming branches (only when necessary) is not reducing the overall patch size of PCT 82 woodland, reducing the impacts to habitat for <i>L. leadbeateri</i>. Retention of the woodland patch will assist in the persistence of <i>L. leadbeateri</i> within the area. Therefore, the proposed works are unlikely to increase the impact of a key threatening process associated with climate change.
Conclusion
The proposed development footprint includes 0.18 ha of potential foraging habitat for <i>L. leadbeateri</i> . The primary action includes vegetation clearing (trimming branches) as part of the proposed conversion of earthen irrigation channels to pipelines. The project would not increase fragmentation and is unlikely to impact movements of the species through the landscape.

Response

Within the proposed work area, no HBTs (breeding habitat) are proposed to be impacted by the proposed works. There are numerous hollows in the wider patch of woodland in the locality. There is no habitat classified as habitat critical to the survival of the Pink Cockatoo, according to the criteria requirements listed in the species' Approved Conservation Advice (DCCEEW, 2023). Grassland within the development footprint is in low condition, likely due to the presence of invasive species and agricultural practices increasing pressures. Although there will be less than 0.18 ha of vegetation removal (in the form of trimming branches of trees), approximately 23,747 ha of woodland, shrubland and grassland foraging habitat would be retained within the locality. With these considerations, the impacts to this species are not considered to be significant.

G.2 Assessment of Significance

- Southern Bell Frog (*Litoria raniformis*)

Vulnerable species

An action is likely to have a significant impact on a vulnerable species if there is a real chance or possibility that it will:

(a) lead to a long-term decrease in the size of an important population

Southern Bell Frog is usually found among vegetation within or at the edges of permanent water such as slow flowing streams, swamps, lagoons and lakes. In disturbed areas it also commonly occurs in artificial waterbodies such as farm dams, irrigation channels, irrigated rice crops and disused quarries, particularly where natural habitat is no longer available (DSE, 2012). Favoured sites frequently have a large proportion of emergent, submerged and floating vegetation, and slow-flowing or still water (Cth DCCEE, 2024).

The Southern Bell Frog prefers to breed during spring and summer triggered by flooding or a significant rise in water levels. The species has been known to breed anytime from early spring through to late summer/early autumn (Sept to April) following a rise in water levels (OEH, 2023). Tadpoles require standing water for at least 4 months for development and metamorphosis to occur but can take up to 12 months to develop.

The Conservation Advice (2024) for the southern bell frog mentions that in the Murray River floodplain, this species has been documented moving several kilometres between waterbodies along drainage lines or other low-lying areas.

The presence of the Southern Bell Frog in the Project Area has been assumed based on local records within 30 km of the Development Footprint near Darlington Point on the floodplains of the Murrumbidgee River (these records are from around 2003), and the presence of potentially suitable habitat in the form of earthen and concrete irrigation channels. These channels are used for irrigation in spring and summer.

Suitable habitat in the Development Footprint is aquatic habitat, consisting of open concrete irrigation channels (approximately 40cm high and 40cm wide), with limited fringing vegetation. Species polygons have been determined by applying a 350 m buffer to the habitat (irrigation channels) as per the Significant impact guidelines (DEWHA, 2009), resulting in an impact area of 226.99 ha for the Southern Bell Frog.

The criteria of an 'Important Population' of the species is outlined in the EPBC Act Policy Statement for the species (DEWHA 2009a, 2009b):

'Much of the habitat for *L. raniformis* has been isolated or fragmented, restricting the opportunity for important population processes such dispersal and colonisation. As such, any viable population is considered to be an important population for the persistence and recovery of the species. For this species, a viable population is one which is not isolated from other populations or waterbodies, such that it has the opportunity to interact with other nearby populations or has the ability to establish new populations when the suitability or availability of waterbodies changes. Interaction with nearby populations and colonisation of newly available waterbodies occurs via the dispersal of individual frogs across suitable habitat.'

While this species is known to utilise irrigation channels (DSE, 2012) the present channels are concrete based hence have minimal vegetation present (only occur on the edge of the channels and where channels are cracked), there is isolation of potential populations due to urbanisation. There are also no local records of this species. Given this any population present is not considered to be a viable population, and therefore, not an 'important population'.

With regards to a 'non-important population' that may occur the irrigation channels present are not likely to be suitable breeding habitat as the channels are narrow and shallow so cannot be inundated with water

An action is likely to have a significant impact on a vulnerable species if there is a real chance or possibility that it will:
and are not considered deep enough for breeding habitat. This along with when the water levels are increased a flow would likely be maintained to enable reaching irrigation crops. This is unsuitable for any tadpoles that may be in the water as they require a still waterbody for at least 4 months. Any present Southern Bell Frog population may be impacted directly by reduced water availability due to channels replacement with pipes, and/or indirectly by reduced water quality from erosion, runoff, dust and pollution in channels that would be retained. Preclearance for this species is recommended to enable relocation.
(b) reduce the area of occupancy of an important population
Any potential population present is not considered to be an ‘important population’, therefore, the area of occupancy would not be reduced. Aquatic habitat in the Project Area consists of the 226.99 ha of irrigation channel. Proposal will reduce the area of occupancy in the local area of any non-important Southern Bell Frog populations by removing 226.99 ha irrigation channels. Given this species is potentially present a preclearance protocol is recommended to enable relocation where needed.
(c) fragment an existing important population into two or more populations
Any potential population present is not considered to be an ‘important population’, therefore fragmentation of one would not occur. For the potential population present the irrigation channel (in area EA12) proposed works would reduce the available aquatic habitat with some existing open concrete irrigation channels being converted to pipelines, however, the shallow open concrete irrigation channels provide limited breeding and foraging habitat (Cth DCCEEW, 2024). Irrigation channels in area EA12 do not connect to primary habitat, such as the Murrumbidgee River, therefore, it is unlikely that irrigation channels are being used as dispersal/recolonisation routes between the Murrumbidgee River and other permanent water bodies.
(d) adversely affect habitat critical to the survival of a species

An action is likely to have a significant impact on a vulnerable species if there is a real chance or possibility that it will:

Habitat critical to the survival of a species may occur but is not limited to habitat identified in a recovery plan for the species or ecological community as habitat critical for that species or ecological community; and/or habitat listed on the Register of Critical Habitat maintained by the minister under the EPBC Act (Cth DCCEEW, 2024).

The Conservation Advice (2024) states the following under the heading ‘Habitat critical to the survival’:

‘Areas with deep water (>1.5 m) that support a dense cover (30–40 % coverage) of submergent and floating vegetation, while also providing for extensive vegetated and/or rocky margins in the shallows, are required to support all life-stages. Critically, water needs to be available over the breeding season (September–February) (DELWP 2017). Vegetation protects all life-stages from predation, with tall emergent vegetation such as reeds and rushes providing protection for adults, while submerged and floating attached vegetation protects eggs and tadpoles (Wassens 2008; DELWP 2017). Warmer shallow areas increase productivity by accelerating vegetation

growth and providing an abundance of invertebrate prey items and quickens tadpole development (Heard et al. 2015). As well as providing refugia from predators, grass and shrub cover on the banks provides habitat for prey items (see Activity, dispersal and diet section). However, banks choked with vegetation prevent dispersal, which is critically important for survival (see Threats). Habitat critical to survival varies between the two lineages of the southern bell frog...Frogs from the semi-arid northern lineage are reliant on large wetland complexes, consisting of

a network of ephemeral waterbodies adjacent to permanent waterbodies, which act as a refuge during drought (Wassens et al. 2008, 2010). Frog presence is correlated with increasing aquatic vegetation complexity and flooding frequency (Wassens et al. 2008, 2010). For both lineages, movement between breeding sites or from refuge habitat is critical for maintaining genetic diversity and allowing temporal variation in habitat use and/or

recolonisation of sites following local extinction (DEWHA 2009; Turner et al. 2022b). Connective habitat includes wet areas, such as riverbanks, wetlands, drainage lines, swales, and other periodically damp areas, as well as grassy open areas (DSG 2015). Terrestrial foraging habitat is often open and contains flowering plants, tussocks, grasses, and foliage (DSG 2015). This vegetation may be near breeding habitat or some distance away, with frogs found up to 500 m from the nearest waterbody. Terrestrial vegetation, along with fallen logs and ground debris surrounding waterbodies provide essential shelter sites as well as over-wintering habitat.’

While the irrigation channels provide water during the breeding season and there is foraging habitat surrounding the waterbody there is a lack of emergent, submergent and floating habitat due to it being a concrete base or disturbed earthen base, the irrigation channels are approximately 40cm deep and there were no deep water bodies (>1.5m) seen during the site visit or visible on aerial imagery or EPI mapping within 500m of the irrigation channels. Given this the Project Area is not a part of critical habitat for the Southern Bell Frog. The proposed works would not adversely affect habitat critical to the survival of this species.

(e) disrupt the breeding cycle of an important population

An action is likely to have a significant impact on a vulnerable species if there is a real chance or possibility that it will:
An ‘important population’ is not considered to be present, as such the breeding cycle is not considered to be disrupted. The Southern Bell Frog breeds in the warmer months (September to April) following a rise in water levels (OEH, 2023). Mating occurs on the edge of, or within, permanent waterbodies, flooded plains, and creek pools, in areas with extensive growth of either emergent or submerged vegetation (Cth DCCEW, 2024). Egg clusters are laid on the water surface or up to 50 cm below it and rapidly sink. The irrigation channel in the Development Footprint is unlikely to have permanence of water for a duration long enough (at least four to 12 months) to allow a tadpole to fully develop into an adult, and is only up to approximately 40cm deep, therefore, is unsuitable as breeding habitat for the Southern Bell Frog that may occur. There are no nearby water courses or waterbodies that connect with the area EA12 irrigation channels.
(f) modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline
The proposed development would remove up to approximately 7.13 ha of aquatic habitat that this species may utilise. Most of the open channels would be converted to pipelines and the channels backfilled. The surrounding terrestrial habitat is disturbed with a history of agricultural use and urban development. While the irrigation channels and adjacent vegetation have potential to be habitat this species has the ability to move 1km in 24hours (DCCEW, 2012) and has been documented to travel several kilometres in the Murray River floodplain (Wassens (2005), in DCCEW 2024). Given the above and that the present irrigation channels have limited habitat suitability for breeding the proposed development is not predicted to modify, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline.
(g) result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species’ habitat
As outlined above, the habitat is already in a disturbed state and can be accessed by people, vehicles, farm animals and pest animals. The proposal would not introduce or exacerbate harmful species into the area of the Southern Bell Frog habitat.
(h) introduce disease that may cause the species to decline, or
The Southern Bell Frog is susceptible to Chytridiomycosis, which is an infectious disease caused by amphibian chytrid fungus (<i>Batrachochytrium dendrobatidis</i>) (DSE, 2012). The fungus can be transferred through soil, therefore, there is a risk of it being carried onto the site through contaminated machinery and footwear. To prevent the spread of the amphibian chytrid fungus, it is recommended that a hygiene protocol is followed. With this protocol followed the proposed works are unlikely to introduce a disease to the Project Area that would cause the Southern Bell Frog to decline.
(i) interfere with the recovery of the species

An action is likely to have a significant impact on a vulnerable species if there is a real chance or possibility that it will:

Currently, a national recovery plan has been adopted for the Southern Bell Frog (DSE, 2012). The species' conservation advice lists the key threats as (Cth DCCEEW, 2024):

- Human Disturbance (e.g., direct mortality and stress/encroachment from human activities)
 - Habitat loss, degradation, and fragmentation
 - Altered hydrology
 - Pollution
- Disease – animal pathogens (chytridiomycosis caused by the chytrid fungus)
- Competition and predation by introduced invasive fish species.
- Habitat damage by livestock
- Predation from foxes
- Climate change (temperature increase, extreme weather events e.g. cyclones, droughts)
 - Increase in drought frequency/severity
 - Increase in fire frequency/severity

The proposal would not exacerbate the threats of fragmentation, disease, predation by foxes, and climate change (see above). To decrease impact to potential populations, present several mitigation measures would be put in place. These include:

- Clear physical demarcation of boundary between retained and cleared areas
- Weed control and hygiene protocol
- Sediment and erosion controls.
- Avoiding undergoing works (as far as practical) in Spring or Summer, which is when Southern Bell Frog are most active and the most likely to utilise the irrigation channels. As reasonable, undergo as much works in Autumn and Winter.
- If works are to be completed in Spring and Summer;
 - A fauna spotter catcher to be on site to confirm if Southern Bell Frog is present, only if a recent, significant rise in water has occurred (a significant flooding event or increased irrigation supply needed). Or;
 - If rain events are not significant enough to create a rise in water- enough that would retain water for at least a four-month period (a significant flooding event), no additional mitigation is required
- An allowable time of two weeks following dewatering of existing earthen channels, or 1-2 days for existing concrete channels would encourage the Southern Bell Frog offsite.

With these mitigation measures in place, the proposal is unlikely to interfere with the recovery of the Southern Bell Frog or to cause significant adverse impacts on the species.

Conclusion

An action is likely to have a significant impact on a vulnerable species if there is a real chance or possibility that it will:

The Southern Bell Frog would have impacts to approximately 7.13 ha of potentially suitable habitat within the project area. Due to the following:

- the Project Area is not considered to contain critical habitat
- the Project Area is not considered to have an important population
- there is a lack of records indicating a lower likelihood of occupation.
- the irrigation channels are shallow, and concrete based
- the irrigation channels' vegetation is restricted to fringing terrestrial habitat which provides limited breeding habitat for the Southern Bell Frog.

The proposed works impacts to this species are not considered to be significant.

- Superb Parrot (*Polytelis swainsonii*) – Vulnerable

An action is likely to have a significant impact on a vulnerable species if there is a real chance or possibility that it will:

(a) lead to a long-term decrease in the size of an important population

The MNES Significant impact guidelines 1.1 states that an 'important population' is a population that is necessary for a species' long-term survival and recovery. This may include populations identified as such in recovery plans, and/or that are:

- *key source populations either for breeding or dispersal*
- *populations that are necessary for maintaining genetic diversity, and/or*
- *populations that are near the limit of the species range.*

The presence of *Polytelis swainsonii* in the proposed work area has been assumed based on the presence of associated PCTs and suitable habitat. There are no known records within the Proposed work area.

Potential suitable habitat in the Involved Lots includes habitat consisting of woodland. *P. swainsonii* is associated with PCT 82, which was identified within the proposed work area.

Within the proposed work area, less than 0.18 ha of potential woodland habitat for this species is proposed to be removed as part of the project (trimming tree branches only where is necessary). No HBTs are within the proposed work area, and therefore no breeding habitat in the form of suitable hollows are being removed (DAWE, 2022)

Superb Parrot have also been observed to utilise hollows with the following hollow measurements:

- Minimum entrance diameter of eight to 12 cm
- Depth of 59-112 cm
- Floor diameter of 15-22 cm

An action is likely to have a significant impact on a vulnerable species if there is a real chance or possibility that it will:

- Branch or stem diameter of 36-49 cm (Stojanovic, et al., 2020)

Due to the hollow requirements of *P. swainsonii*, potential nesting and breeding habitat absent within the proposed work area.

There are three main breeding areas for *P. swainsonii*, one of which occur within a 10 km radius of the proposed work area. In the Riverina, this species nests in loose colonies in large, living or dead trees with many hollow branches, typically near a watercourse. On the inland slopes, they use at least six species of eucalypts. They also have an assumed reliance on White Box and Yellow Box trees. Most nest sites are within 10 km of Box-Gum Woodland and are sometimes within it. After breeding, they use a variety of woodland types and other habitat types and mostly feed on the ground (Threatened Species Scientific Committee, 2016)

The core breeding areas of *P. swainsonii* are found along the Murray and Edward Rivers, Murrumbidgee River and in a triangular area bounded by Molong, Yass and Young (DCCEEW, 2025). The closest core breeding area is located along the Murrumbidgee River, approximately 7 km south from the proposed work area. There are no records of this species within the proposed work area. Within 10 km of the proposed work area there are 7115 records (BioNet, 2025)

An important population is considered to occur as the proposed work area is within a known core breeding area, with over 7000 records within the 10 km locality (BioNet, 2025). However, because the proposed works are impacting less than 0.18 ha of foraging habitat **it is unlikely that the proposed action would lead to a long-term decrease in the size of an important population of the species.**

(b) reduce the area of occupancy of an important population

One of the key attributes that classifies a population as being important and necessary for a species' long-term survival and recovery include 'key source populations either for breeding or dispersal'.

The core breeding areas of *P. swainsonii* are found along the Murray and Edward Rivers, Murrumbidgee River and in a triangular area bounded by Molong, Yass and Young (DCCEEW, 2025). The closest core breeding area is located along the Murrumbidgee River, approximately 7 km south from the proposed work area. Birds may forage up to 10 km from nesting sites, primarily in Box-Gum Grassy Woodland (Threatened Species Scientific Committee, 2016). This is evident in the 7115 records of Superb Parrot within a 10km locality.

In addition, SVTM shows that there is approximately 20,688 ha of woodland within 10 km of the proposed work area, providing good connectivity along the Murrumbidgee River and its tributaries (NSW DCCEEW, 2020). This is located south of the proposed work area, with the PCT comprising River Red Gum shrub/grass riparian tall woodland or open forest wetland. In the Riverina, this species breeds in River Red Gum forests and woodland, typically close to watercourses (DCCEEW, 2025). The proposed work area falls within core breeding areas and over-wintering areas, with an abundance of preferred habitat in the wider locality. The proposed works, however, are impacting less than 0.18 ha (trimming tree branches where necessary), **it is unlikely that the proposed works would reduce the area of occupancy of an important population.**

There are over 20,000 ha of woodland within the locality that are not being impacted by the proposed works.

An action is likely to have a significant impact on a vulnerable species if there is a real chance or possibility that it will:

(c) fragment an existing important population into two or more populations

There are no records of *P. swainsonii* within the proposed work area, assessment area. There are 7115 records within 10 km of the proposed work area (BioNet, 2025). The proposed impacts would upgrade existing earthen irrigation channels to pipelines, with a tree protection zone established within around the PCT 82 mapped areas, with only potential to trim branches, if necessary, causing no additional fragmentation. As *P. swainsonii* is highly mobile and there is minimal change in land use from the new pipeline, **it is unlikely that the proposed project will fragment an existing population into two or more populations.** The retained vegetation provides a sufficient habitat corridor for the species to move throughout the landscape, in addition to providing foraging habitat.

(d) adversely affect habitat critical to the survival of a species

Critical habitat for the Superb Parrot is divided into breeding and foraging habitat. Breeding habitat consists of Riverine forests in the Riverina and Box-gum woodlands in the tablelands and slopes and relies on mature or dead eucalypts, including River Red Gum, Blakely's Red Gum, Grey Box, Red Box and Inland Red Box, with hollows. Foraging habitat critical to the species survival includes Weeping Myall *Acacia pendula* woodlands between the Murrumbidgee and Murray Rivers, River Red Gum forest and box-pine woodland in north-central NSW and River Red Gum, box-pine, box, pine and Boree woodland in the Riverina (Threatened Species Scientific Committee, 2016)

No habitat critical to the survival of this species is listed in its Approved Conservation Advice (Threatened Species Scientific Committee, 2016), or on the Register of Critical Habitat (DCCEEW, 2014)

No habitat critical to the survival of *P. swainsonii* occurs within the Proposed work area. There are Semi-Arid Woodlands within the locality to provide a sufficient habitat corridor for the species to move throughout the landscape, in addition to providing foraging habitat. There are no known areas of breeding habitat present in the Proposed work area (in the form of suitable HBTs). **Therefore, the proposed action would not adversely affect habitat critical to the survival of the species.**

(e) disrupt the breeding cycle of an important population

Key Biodiversity Areas (KBAs) for this species includes an area of 2,451 km², with two stretches of core breeding areas along the Murrumbidgee River. One extends from Central Wagga Wagga to about 60 km downstream to around the west end of Berry Jerry State Forest. The other is from Narrandera, downstream to Cumbungi Creek and Lagoon, about 20 km downstream from Benerembah State Forest and also including Cuba, Wilbriggie and Yarradda State Forests. Both components of the KBA include a 10 km buffer zone on either side (DAWE, 2022). The closest core breeding area is approximately 30 km north of the proposed work area.

The proposed work area is within the core breeding area of the species and contains PCT 82 *Western Grey Box - Poplar Box - White Cypress Pine tall woodland*, in restricted areas within the proposed work area, with the overall patch extending to a larger patch that is being avoided by the proposed works. A TPZ will be established, with minimal impacts to vegetation proposed (trimming tree branches, only if necessary).

An action is likely to have a significant impact on a vulnerable species if there is a real chance or possibility that it will:

Surrounding areas have general degradation across the area as a result of agricultural activities. With consideration of these factors, **the proposal is unlikely to disrupt the breeding cycle of an important population.**

(f) modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

0.18 ha of potential foraging habitat for *P. swainsonii* occurs within the proposed work area. This vegetation, and the surrounding vegetation in the proposed work area, is in poor to low condition as a result of land use including agricultural related activities. The main identified threats to this species are loss and degradation of habitat, competition for nest hollows, road kills due to vehicle collision, illegal removal of wild birds, psittacine beak and feather disease (PBFD) and climate change (Threatened Species Scientific Committee, 2016). Given that the project proposes removal of less than 0.18 ha of potentially suitable foraging habitat that has been significantly modified and disturbed by land use, **the species is not likely to decline as a result of modifying, destroying, removing or decreasing the availability of habitat.**

(g) result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

Invasive species that are harmful to *P. swainsonii* becoming established in its habitat include invasive species such as the Common Starling *Sturnus vulgaris* and the introduced Honeybee *Apis mellifera* which compete for hollows as roosting and / or breeding habitat (Threatened Species Scientific Committee, 2016). It is not predicted that the proposed action would result in an increase of the presence of these invasive species.

The proposed project has the potential to contribute to the spread of invasive species, mainly through the clearing of vegetation, in addition to potential transfer and introduction of both plant material and soil on machinery. Mitigation measures have been recommended in the REF to prevent the spread of weeds throughout the project area.

Additionally, *P. swainsonii* has not been recorded within the proposed work area or wider locality and therefore **it is unlikely that the proposed work will result in invasive species that are harmful to *P. swainsonii* becoming established in its suitable habitat (BioNet, 2025)**

(h) introduce disease that may cause the species to decline, or

P. swainsonii is at risk of Psittacine Beak and Feather Disease (PBFD), a potentially fatal disease caused by psittacine circovirus. The disease is typically transferred between adults and nestling. The ongoing loss of nest hollows is likely to intensify competition and use of nest trees and increase the transmission likelihood of the disease (Threatened Species Scientific Committee, 2016). There are no HBTs within the proposed work area, resulting in a low likelihood of increasing competition, and PBFD.

There is a risk that diseases could be introduced to the proposed work area via machinery, vehicles, and materials during construction and operation. With the implementation of the recommended mitigation

An action is likely to have a significant impact on a vulnerable species if there is a real chance or possibility that it will:

measures, **the proposal is unlikely to result in the introduction of any disease that may cause these species to decline.**

(i) interfere with the recovery of the species

A Recovery Plan currently exists for *P. swainsonii*. Key objectives in the recovery plan are conservation-focussed, in addition to reducing the effects of climate change and anthropogenic threats on this species (DAWE, 2022)

The conservation actions under Strategy 1 in the Federal Recovery Plan include:

- Identify areas of high conservation significance and habitat critical to the survival of *P. swainsonii*
- Protect and manage critical habitat areas that are not currently managed for nature conservation
- Restore existing and future habitat in strategic locations close to, and within key sites and known movement corridors
- Review and review management priorities, recommendations, planning tools and procedures (as appropriate) as new information becomes available
- Develop agreements with priority local government and government agencies that aim to maintain and/or improve breeding and foraging habitat
- Incorporate *P. swainsonii* conservation priorities into agreements and private land conservation programs
- Examine use of known *P. swainsonii* hollow nests by other species to understand species competition and potential impacts
- Conduct research to evaluate nest box and artificial hollow effectiveness, and strategic hollow enhancement (DAWE, 2022)

Considering these factors, **it is unlikely the impacts from the proposed action will substantially interfere with the recovery of the species.** This is due to the absence of HBTs and the minimal impact to 0.18 ha of PCT 82 that could provide potential foraging habitat.

Conclusion

The proposed action is not likely to lead to a long-term decrease in the size of an important *P. swainsonii* population, reduce its area of occupancy or fragment an existing important population into two or more populations. It is not likely to adversely affect habitat critical to the survival of the species, disrupt the breeding cycle of a population or interfere with the recovery of the species. Due to the degraded condition of the landscape and that multiple key threats already impact the development footprint, the proposed action is not likely to modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline. With standard biosecurity protocols in place, the proposed action is not likely to introduce disease that may cause the species to decline, or result in invasive species becoming established in the species' habitat. Recommended mitigation measures include:

An action is likely to have a significant impact on a vulnerable species if there is a real chance or possibility that it will:

- Vehicles and machinery to be checked for soil and plant matter and washed down prior to entering the site
- Brushing and cleaning boots if walking through native vegetation.

Considering the above factors, **the proposed action is not likely to have a significant impact on *Polytelis swainsonii*.**

- Pink Cockatoo (*Lophochroa leadbeateri*) – Endangered

An action is likely to have a significant impact on a critically endangered or endangered species if there is a real chance or possibility that it will:

(a) lead to a long-term decrease in the size of a population

The MNES Significant impact guidelines 1.1 states a 'population of a species' is defined under the EPBC Act as an occurrence of the species in a particular area. In relation to critically endangered, endangered or vulnerable threatened species, occurrences include but are not limited to:

- *a geographically distinct regional population, or collection of local populations, or*
- *a population, or collection of local populations, that occurs within a particular bioregion.*

The presence of the *Lophochroa leadbeateri* in the proposed work area has been assumed based on the presence of associated PCTs and suitable foraging habitat. There are no known records within the proposed work area.

L. leadbeateri is a species of parrot found across the arid and semi-arid inland, from south-western Queensland to north-west Victoria, through most of South Australia, into the south-west Northern Territory and across to the west coast between Shark Bay and Jurien. In NSW it is found regularly as far east as about Bourke and Griffith, and sporadically further east (NSW OEH, 2024). The proposed work area resides outside of the species' known or predicted distribution areas under the federal threatened species profile (DCCEEW, 2025) however is included in the NSW species profile distribution (NSW OEH, 2024). *L. leadbeateri* is associated with PCT 82, found within the proposed work area. There are 798 BioNet records of the *L. leadbeateri* within 10 km of the proposed work area.

L. leadbeateri relies on large, tall trees with large hollow dimensions for nesting. The species is known to forage on seeds of native shrubs and trees, and sometimes forages on roots, bulbs, insect larvae, seeds of crops and weeds (DCCEEW, 2023). Foraging habitat is present within the proposed work area in the form of woodland. There are no hollow-bearing trees (HBTs) within 1km of the proposed work areas. However, as no HBTs are within the proposed work area, or in adjacent areas, **it is unlikely that the proposed project will lead to a long-term decrease in the size of a population of this species.**

(b) reduce the area of occupancy of the species

An action is likely to have a significant impact on a critically endangered or endangered species if there is a real chance or possibility that it will:

The proposed work will trim branches to 0.18 ha of potential foraging habitat for this species within the proposed work area. The location of the Proposed work area is predominantly surrounded by cleared land for agricultural use, highlighting the importance of woodland within the locality as habitat for this species. Although minimal impacts in the form of trimming of branches to 0.18 ha of PCT 82 woodland habitat, approximately 23,747 ha of woodland, shrubland, and grassland foraging habitat adjacent and connected to the proposed work area (locality) would be retained. As there are only minimal impacts to Pink Cockatoo habitat, and no direct impacts to breeding habitat (in the form of suitable HBTs), **it is unlikely that the proposed work will significantly reduce the area of occupancy for the species.**

(c) fragment an existing population into two or more populations

There are no records of *L. leadbeateri* within the proposed work area, assessment area. There are 798 records within 10 km of the proposed work area (BioNet, 2025) The proposed impacts would upgrade existing earthen irrigation channels to pipelines, with a tree protection zone established within around the PCT 82 mapped areas, with only potential to trim branches, if necessary, causing no additional fragmentation. As *L. leadbeateri* is highly mobile and there is minimal change in land use from the new pipeline, **it is unlikely that the proposed project will fragment an existing population into two or more populations.** The retained vegetation provides a sufficient habitat corridor for the species to move throughout the landscape, in addition to providing foraging habitat.

(d) adversely affect habitat critical to the survival of a species

The MNES Significant impact guidelines 1.1 states ‘Habitat critical to the survival of a species or ecological community’ refers to areas that are necessary:

- *for activities such as foraging, breeding, roosting, or dispersal*
- *for the long-term maintenance of the species or ecological community (including the maintenance of species essential to the survival of the species or ecological community, such as pollinators)*
- *to maintain genetic diversity and long term evolutionary development, or*
- *for the reintroduction of populations or recovery of the species or ecological community.*

Such habitat may be, but is not limited to: habitat identified in a recovery plan for the species or ecological community as habitat critical for that species or ecological community; and/or habitat listed on the Register of Critical Habitat maintained by the minister under the EPBC Act.

- No Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat (DCCEEW, 2025)

Habitat critical to the survival of the *L. leadbeateri* listed in the Conservation Advice (DCCEEW, 2023) consist of:

- Arid and semi-arid woodlands dominated by mulga (*Acacia aneura*), mallee and box eucalypts, slender cypress pine (*Callitris gracilis*) or Belah (*Casuarina cristata*)

An action is likely to have a significant impact on a critically endangered or endangered species if there is a real chance or possibility that it will:

- Known habitat containing suitable attributes, including potential habitat for the subspecies, especially where there are large mature trees with suitable hollows; and
- Surrounding matrix of these areas for the role of providing movement corridors for dispersal across the landscape

No habitat critical to the survival of *L. leadbeateri* occurs within the Proposed work area. There are Semi-Arid Woodlands within the locality to provide a sufficient habitat corridor for the species to move throughout the landscape, in addition to providing foraging habitat. There are no known areas of breeding habitat present in the Proposed work area (in the form of suitable HBTs). **Therefore, the proposed action would not adversely affect habitat critical to the survival of the species.**

(e) disrupt the breeding cycle of a population

L. leadbeateri relies on hollows with specific qualities for nesting and breeding. Suitable nesting hollows are found in trees that are large and tall with the following dimensions:

- average hollow entrance diameter of 13.3 x 27.7 cm (range 8-30 x 9-80 cm, horizontal x vertical diameter); average hollow depth of 53.9 cm (range 19 – 180 cm)
- average nest chamber floor diameter of 18 cm (range 9-34 cm)
- average nest tree diameter at breast height of 72.5 cm (range 34-149 cm) (DCCEEW, 2023)

Additionally, the species does not prefer nests within close proximity to other *L. leadbeateri* breeding pairs. No HBTs with suitable hollows are present within the proposed work area, or within a 1km radius of adjacent habitat. The proposed project works are not proposing to remove any HBTs. **It is therefore unlikely that the proposed project would disrupt the breeding cycle of a *L. leadbeateri* population.**

(f) modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The proposed work will trim branches to 0.18 ha of potential foraging habitat for this species within the proposed work area. Within the proposed work area, 0.18 ha of PCT 82 would be retained with a TPZ established, and only trimming of branches proposed. In addition, approximately 23,747 ha of woodland, shrubland, and grassland foraging habitat adjacent and connected to the proposed work area (locality) would be retained. This results in less than 0.18 ha of suitable habitat being removed, which is less than 0.001% of the total potential suitable habitat in the proposed work area being impacted by the project.

The proposed work area has already been previously disturbed from earthen irrigation channel construction, agricultural activities. **It is unlikely the that proposed action would decrease the availability or quality of habitat to the extent that the species is likely to decline.**

(g) result in invasive species that are harmful to a critically endangered or endangered species becoming established in the endangered or critically endangered species' habitat

An action is likely to have a significant impact on a critically endangered or endangered species if there is a real chance or possibility that it will:

The MNES Significant impact guidelines 1.1 states that an 'invasive species' is an introduced species, including an introduced (translocated) native species, which out-competes native species for space and resources or which is a predator of native species. Introducing an invasive species into an area may result in that species becoming established. An invasive species may harm listed threatened species or ecological communities by direct competition, modification of habitat or predation.

The proposed action has the potential to contribute to the spread of invasive weed species in the proposed work area through the transfer and introduction of plant material and soil on machinery. Any removal of native plant species also presents opportunities for invasive species to establish where ground cover is exposed. The implementation of appropriate biosecurity practices will assist to prevent and control these impacts. With the implementation of these mitigation measures, the proposal is not considered likely to exacerbate this impact to the point that it would constitute a substantial reduction in the quality or integrity of the species habitat within the proposed work area.

The proposed project is considered unlikely to generate an increase in invasive fauna species harmful to the species, such as feral cats or foxes, above what is currently present. The habitat in the locality is already disturbed from past track construction, agricultural activities and current vehicle movements and the proposal is unlikely to bring in new sources of habitat for feral species. **The project is not considered likely to exacerbate this impact to the point that it would constitute a substantial reduction in the quality or integrity of the species habitat within the proposed work area.**

(h) introduce disease that may cause the species to decline

L. leadbeateri is at risk of Psittacine Beak and Feather Disease (PBFD), a potentially fatal disease caused by psittacine circovirus. This is typically transferred between adults, nestlings and contaminated nest hollows, with most positive cases recorded in the eastern subspecies (DCCEEW, 2023)

There is a risk that diseases could be introduced to the proposed work area via machinery, vehicles, and materials during clearing, construction and operation. With the implementation of the recommended mitigation measures, **the proposal is unlikely to result in the introduction of any disease that may cause the species to decline.**

(i) interfere with the recovery of the species

There is currently no nationally adopted or Recovery Plan made for this species. A Saving our Species (SoS) strategy exists for the *L. leadbeateri*, which aims to ensure that the species is secure in the wild in NSW (NSW DPE, 2025). This strategy aims to ensure that its NSW geographic range is extended or maintained, and that its conservation status under the BC Act is maintained, or improved. Actions for the species include:

- Encourage landholders with suitable breeding habitat to enter into covenants or stewardship agreements that promote the retention of large hollow-bearing trees, including paddock trees.
- Undertake revegetation focusing on planting hollow-bearing tree species in areas where particular age/size cohorts are missing from the landscape, to ensure a continual supply of breeding habitat, particularly in areas known to be used by the species.

An action is likely to have a significant impact on a critically endangered or endangered species if there is a real chance or possibility that it will:

- Raise awareness and encourage relevant landholders and land managers to implement sensitive grazing practices that minimise the removal of seeding grasses and recruiting feed plants (e.g. saltbush, wattles, cypress pine) and nesting (hollow-bearing) trees.
- Promote awareness among local communities of the impacts of illegally removing birds or nestlings from the wild as well as the threatened status of the species. Encourage the reporting of suspected nest robbing or trapping to Environment Line (131 555).

The proposed project is unlikely to interfere with the above outlined actions to the degree in which the proposed works will interfere with the recovery of the species.

Conclusion

The proposed development footprint includes 0.18 ha of potential foraging habitat for *L. leadbeateri*. The primary action includes vegetation clearing (trimming branches) as part of the proposed conversion of earthen irrigation channels to pipelines. The project would not increase fragmentation and is unlikely to impact movements of the species through the landscape.

Within the proposed work area, no HBTs are proposed to be impacted by the proposed works. There are numerous hollows in the wider patch of woodland in the locality. There is no habitat classified as habitat critical to the survival of the Pink Cockatoo, according to the criteria requirements listed in the species' Approved Conservation Advice (DCCEEW, 2023). Grassland within the development footprint is in low condition, likely due to the presence of invasive species and agricultural practices increasing pressures. Although there will be less than 0.18 ha of vegetation removal (in the form of trimming branches of trees), approximately 23,747 ha of woodland, shrubland and grassland foraging habitat would be retained within the locality. With these considerations, the impacts to this species are not considered to be significant.

Appendix H Aboriginal Due Diligence Assessment

Aboriginal Due Diligence Assessment – Area 12

This brief report has been drafted in keeping with the sequence of steps identified in the NSW Office of Environment and Heritage's *Due Diligence Code of Practice for the Protection of Aboriginal Objects in NSW* (OEH 2010). The Code of Practice provides a stepped approach to determine if an activity is likely to cause harm to an Aboriginal object, as defined by the *NSW National Parks and Wildlife Act 1974*. The steps follow a logical sequence of questions, the answer to each question determines the need for the next step in the process. The Code of Practice sets out the steps which the Proponent is required to take in order to:

- Identify whether Aboriginal objects are, or are likely to be, present in the works area; and
- Determine whether or not their activities are likely to harm Aboriginal objects.

Each question follows the relevant steps outlined in the Code of Practice.

This assessment reviews the proposed Area 12 works at Leeton in the Riverina of NSW.

Step 1.

Will the activity disturb the ground surface or any culturally modified trees?

The proposed works engage with water reticulation systems owned and operated by Murrumbidgee Irrigation. The water reticulation system includes pipes, tunnels, canals, pumping stations and related electricity infrastructure and dosing facilities.

The Area 12 Project Area works that are subject to this assessment will be undertaken for the water reticulation system include the excavation and construction of a new section of pipeline to replace an existing channel from the Main Canal and around the Oasis Caravan Park on Corbie Hill Road and north along Curtin Road in the Leeton Shire Council Local Government Area (LGA). These activities will entail substantial ground disturbance, however the area of land that the new pipeline will be constructed within has been subject to previous excavation for pre-existing channels located along the entirety of the alignment with the exception of Curtin Road. Curtin Road does not show any evidence of a pre-existing channel however, there is considerable disturbance from the sealed road, residential housing and associated infrastructure. A section of the existing channel around the caravan park will be removed or decommissioned.

Five laydown areas are proposed around the Area 12 Project Area, three to the north of Corbie Hill Road and two to the south.

No previously recorded culturally modified trees or old growth mature native trees are located within the Area 12 Project Area. Although there are some trees visible within some parts of the Project Area on the satellite imagery these do not appear to be remnant old growth trees but deliberate plantings and are, therefore, unlikely to be culturally modified trees.

As ground disturbance is confirmed the next step in the due diligence process is required.

Step 2a.

Search the AHIMS database and use any other sources of information of which you are already aware.

The Aboriginal Heritage Information Management System (AHIMS) provides a database of previously recorded Aboriginal heritage sites in NSW although it is not conclusive evidence of the presence or absence of Aboriginal heritage sites. On 18th March 2025, a search of the AHIMS database was undertaken over an area of approximately 1,400 km² centred on the Project Area. The AHIMS Client Service ID was 986269.

There were 106 Aboriginal sites, and no declared Aboriginal Places recorded within the search area. Sites located in the area included artefact scatters, modified trees, hearths, Aboriginal ceremony and dreaming, burials, PAD, shell and stone arrangements.

There are no Aboriginal sites recorded within or in close proximity to the Project area (Figure 1). The closest recorded sites are 2.7km to the west of the Project Area. These sites are modified trees in association with what appears to be an artificial waterbody but may be a natural modified waterbody. It is likely that there would have been other ephemeral waterholes in the area that have now either been removed, or disturbed by extensive land modification and tree clearing for pastoralism in the area. The original hydrological regimes have also been altered through irrigation works associated with the Murrumbidgee Irrigation System.

Other heritage register searches were also undertaken to identify any items or places in proximity to the proposed work areas. The NSW State Heritage Inventory (SHI), includes items on the State Heritage Register (SHR) and items listed by state agencies and the local Government, to identify any items currently listed within or adjacent to the work areas. The SHI database also includes declared Aboriginal Places in NSW. A search of the SHI database was conducted, which revealed there is one declared Aboriginal Place within the Leeton Shire Council LGA. The Aboriginal Place is a ceremonial site (Koonadan), including burials, located approximately 4km northeast of the Project Area. Koonadan (AHIMS #49-2-0012) is also listed on the AHIMS register and is located on sand dunes near the Tuckerbil Swamp. The nearest listed item on the Local Environmental Plan (LEP) was the House (LEP #10) located approximately 1.2km to the west of the Project Area. This site is not listed for Aboriginal significance.

Environmental Context

The study area is positioned within the broader Murrumbidgee River floodplain about 6.5km northeast of the river. The base geology comprises millennia of flood deposits of the Shepparton formation of poorly consolidated clay, silts, sand and gravel. The Project Area is located within the Murrumbidgee Scalded Plains Mitchell Landscape.

The Murrumbidgee Scalded Plains comprises Quaternary alluvial deposits with native vegetation typical of low shrublands and grasslands and saltbushes. There is little topographic variation within the landscape of Area 12, with the area considered very flat, there is no discernible variation in the elevation from one part of the area to another.

The Murrumbidgee Irrigation Scheme was approved by the NSW Government in 1906 and the first farms established in the area about 1916. The establishment of the irrigation scheme led to development of the region through construction of irrigation channels, either by constructing new ones or channelising existing creek lines and construction of banks and levees. The scale of the development and the subsequent division of the landscape into irrigation bays required extensive earthworks, including clearing and levelling of the ground surface.

The Area 12 channels Project Area is situated on the eastern outskirts of the town of Leeton. The Project Area is located amongst some medium density residential housing in the west of the Project Area but is mostly located around small pastoral holdings and recreation areas. The channels ring an elevated rise on the floodplain that also now contains a caravan park situated on the crest. The elevated terrain has the potential to have been a focus of Aboriginal occupation, being an elevated vantage point, elevated 10m above the surrounding plain.

Overall, the proposal area would be categorised as highly disturbed through construction and maintenance of the channels, roads and housing and associated services.

Archaeological Context

The Leeton area is within an area identified as part of the Wiradjuri language group. This is an assemblage of many small clans and bands speaking a number of similar dialects (Howitt 1996, Tindale 1974, MacDonald 1983, Horton 1994). The Wiradjuri language group was the largest in NSW prior to European settlement. The borders were however, not static, they were most likely fluid, expanding and contracting over time to the movements of smaller family or clan groups. Boundaries ebbed and flowed through contact with neighbours, the seasons and periods of drought and abundance.

European settlers started arriving in the district in the 1830s, after the explorer Oxley passed through the region in 1817. At this point the Aboriginal population was in decline, due to disease such as small pox and influenza as well as dispossession from traditional lands and acts of violence against the Aboriginal people meant there was great social upheaval and partial disintegration of the traditional way of life. This meant that access to traditional resource gathering and hunting areas, religious life and marriage links and access to sacred ceremonial sites were disrupted or destroyed.

However, despite these disruptions, Aboriginal people continued maintain their connections to sites and the land in the early days of European settlement. Where Aboriginal people were taken to places like Warangesda, a mission established near Darlington Point in 1880, people were able to maintain at least some form of association with country and tell traditional stories and Wiradjuri people continue to have a strong connection to their land.

There have been very few archaeological surveys conducted within the wider Leeton area although some have been completed in a broader region, that can assist in development of models of Aboriginal site location. A summary of these reports relevant to the current area is provided in Table 1 below.

Table 1 Summary of previous archaeological assessments.

Project	Relevant Findings	Relevance to Area 12
Gollan 1982 Griffith to Darlington Point transmission line	Recorded artefact scatters on either side of Mirrool Creek, a stone quarry on Whitton Road. No other sites nearby Leeton.	22.5km east of the Project Area
Thompson 1982 Darlington Point to Yanco Transmission line.	Recorded scarred trees, possible oven sites, surface scatter or artefacts, four isolated artefacts.	11.5km south of the Project Area
Creamer 1985 Koonadan - Tuckerbil study	Area of very high cultural significance to local Aboriginal people, including presence of burials and ceremonial ground.	8km north of the Project Area
McIntyre 1985 Darlington Point to Deniliquin transmission line.	27 sites recorded, mostly scarred trees and artefact scatters, mostly clustered around water courses.	28km south of the Project Area

After considering the results of these and other archaeological assessments in the region, it is possible to provide a model of Aboriginal site location to predict the potential of finding different types of sites in the region.

Table 2 Summary of predictive model.

Site Type	Description	Potential
Artefact scatters	Artefact scatter sites can range from two artefacts to high-density concentrations containing hundreds of stone artefacts. The size of these sites usually correlates with proximity to sources of fresh water.	Low potential to occur due to significant ground disturbance which has occurred during the construction and maintenance of the existing channels and roads. Given the disturbances of the area remnant low density scatters would likely be displaced and not located in their original context.
Isolated artefacts	These sites consist of a single artefact and usually represents accidental discard or disposal. Can occur anywhere.	Potential to occur anywhere however given the disturbance of areas any isolated finds would likely be displaced and not located in their original context. May be remnants of larger sites now destroyed.
Modified Trees	Trees that have undergone cultural modification. These require the presence of mature native trees and are likely to be concentrated along major waterways and around swamps or depression areas.	Potential to occur within areas where there are remnant mature native trees, and dead or fallen mature trees.
Burials	Ancestral Aboriginal burials are generally found in elevated sandy contexts or in association with rivers and major creeks.	Unlikely to occur due to historic disturbances of the channels and roads as well as the absence of elevated sandy landforms or major creeks within the area.
Hearth/Ovens	Are identified by burnt clay used for heat retainers. Some are recorded in the district in association with resource locations. Hearths are generally considered to be limited, one-off use or perhaps reused only a few times and generally contain smaller concentrations of heat retainers. Ovens/mounds are considered to represent larger features, reused frequently over time, often extending over a larger area and can include other material such as bone.	Unlikely to occur due to historic disturbances, none have been recorded in the immediate area.

Site Type	Description	Potential
Potential Archaeological Deposits (PADs)	Potential subsurface deposits of archaeological material.	PADs have potential to occur in areas that are likely to have reasonable subsurface deposits in archeologically sensitivity landforms which are relatively undisturbed. While this feature has been recorded in the region the level of existing disturbance of the areas adjacent to the road suggests that this site type is unlikely to occur.

Understanding the landscape context of the proposed work areas assists in building an archaeological predictive model of the area and assist to identify local resources which may have been utilised by Aboriginal people. This information can then potentially be used in predicting the nature of Aboriginal occupation across the landscapes within and adjacent to the proposed work areas. Factors that are typically used to inform the archaeological potential of landscapes include the presence or absence of resources that would have been utilised by Aboriginal people including water, animal and plant foods, stone and other resources.

Based on the outline of previous results in the region, and the assessment of the types and location of sites, it is possible that artefact type sites (scatters and isolated finds) and scarred trees may occur adjacent to the Area 12 channels.

Step 2b.

Are activities proposed in areas where landscape features indicate the presence of Aboriginal objects?

The *Due Diligence Code of Practice for the Protection of Aboriginal Objects in NSW (Code of Practice)* outlines a range of landscape features that have higher potential to contain Aboriginal objects. It is also necessary to consider whether there are landscape features of undisturbed land that may contain Aboriginal objects. These include land that is:

- within 200m of water;
- located within a sand dune system;
- located on a ridge top, ridge line or headland;
- located within 200m below or above a cliff face, or
- within 20m of a cave, rock shelter or cave mouth.

There are no water courses mapped near the Project Area. The proposed works are located approximately 8.5km southeast of Tuckerbil Swamp (ephemeral depression) around which multiple Aboriginal sites have been recorded. The Project Area is also located approximately 2.1km south of the Fivebough Wetlands and whilst there are no previously recorded sites in that location currently the potential for Aboriginal heritage sites is high. The topography in this area is flat with very little elevation change across the floodplain even at distance from major waterways. Although the Project Area is outside the 200m buffer that is listed within the *Due Diligence Code of Practice* as a more sensitive area for Aboriginal sites to occur, there is still potential for sites to occur some distance away especially considering the uniform topographic landscape and findings from previous surveys.

Although the Project Area has also been disturbed through excavation for existing channels the area may have contained isolated artefacts or artefact scatters in the past. Further, despite the extensive disturbance to the proposed pipeline alignment the laydown areas are less disturbed.

Impact avoidance

Step 3. Can any AHIMS listed objects, or landscape features be avoided?

There are no known Aboriginal heritage sites within the proposed works area. There is some potential to limit the risk of impacting unrecorded Aboriginal archaeological objects if present, through managing the work program in those areas where sites have potential to occur. The program of work is varied however, and the channels themselves cannot now be realigned or avoided. The construction of the channels has resulted in considerable disturbance from earthworks and the proposed expansion cannot be relocated to another area.

There are no identifiable landscape features within Area 12 that would be considered as having high archaeological potential, while the general floodplain would be considered to have low to moderate potential based on other survey results from the region. This assumes a low level of disturbance, however the proximity of the Project Area to several known wetlands increases the likelihood of Aboriginal objects being present.

The proposed works are shown in detail in Figure 2.

Desktop Assessment

The assessment of the project impacts on Aboriginal heritage was undertaken at a desktop level utilising the results of the background setting information including AHIMS results and aerial imagery and street view imagery publicly available in consideration of the type of activity proposed.

The proposed replacement of the channel with a new pipeline is identified for the sections of channel between the Main Canal and Corbie Hill Road as it loops around the caravan park. New pipeline is also proposed for Curtin Road and a section of channel to the east of the caravan park is due to be removed or decommissioned. There is also a proposed laydown area in a large grassed area between Crowes Road and Bourke Road. Several laydown areas are located around Corbie Hill Road. All of these areas are shown in detail in Figure 2.

The following table outlines the assessment of each portion in relation to the potential for Aboriginal heritage items to occur.

Table 3 Summary assessment of works at Area 12.

Location	Description	Conclusion
Approximately 3.3km from Main Canal to the north of Corbie Hill Road then loops back around. Laydown Area 1: 140m x 590m on the eastern inside edge of the loop. Laydown Area 2: 330m x 275m on the northern side of	The proposed new pipeline follows an existing channel of varying widths for 2.2km. A section of existing channel will be removed or decommissioned for 860m. This channel is surrounded by both pastoral land with non-native trees and remnant vegetation that does not appear to have been modified. There is potential for native old growth trees. Laydown Area 1 is located on the eastern inside	Very low potential for Aboriginal heritage to occur along the channel and around Corbie Hill Road where previous disturbance has occurred. Moderate potential for Aboriginal heritage to occur on the elevated rise south of

Location	Description	Conclusion
Corbie Hill Road inside the eastern edge of the loop. Laydown Area 3: 130m x 170m on the outside eastern edge of the loop.	edge of the loop. The northern section has been partially disturbed through previous construction and fence building and possibly use as a dumping area for machinery and cars. The southern end appears relatively undisturbed and contains some remnant vegetation although there have been some modifications for fence building. Laydown Area 2 is located on the northeastern inside of the loop on the northern slope of the elevated rise within the grounds of a large residential holding. Vegetation appears to be non native and is primarily grass and relatively undisturbed. Laydown Area 3 is located on the northwestern inside of the loop on the northern side of the elevated rise within the grounds of a large residential holding. Vegetation appears to be non native including grass and relatively undisturbed.	the caravan park and inside the northern loop where land modifications have been minimal.
Approximately 405m from Corbie Hill Road north along Curtin Road.	New pipeline is proposed along this section of the alignment which follows an existing channel along Corbie Hill Road then runs under Curtin Road. The alignment along Curtin Road is disturbed by the sealed road, house construction and associated infrastructure.	Very low potential for Aboriginal heritage to occur between road and channel.
Laydown Area 1: 130m x 260m Laydown Area 2: 245m x 260m	Laydown Area 1 is located on the outside southeastern edge of the loop. It appears to be bordered by a fence but looks to contain some remnant native vegetation and low-lying swampy areas. This area is part of the basal slope of the elevated rise. Laydown Area 2 has been cleared of native vegetation and contains few trees that are likely non native. It is surrounded by low density housing and pastoral holdings but is on the interface between the floodplain and the elevated rise.	Moderate potential for Aboriginal heritage to occur within Laydown Area 1. Moderate potential for Aboriginal heritage to occur within Laydown Area 2.

Visual Inspection

The assessment process is primarily a desktop exercise, using available information such as the AHIMS search results and relevant archaeological reports to develop or refine a model of Aboriginal site prediction based on the type of activity proposed and the level of disturbance of the area. A visual inspection is also required where landscape features are present that may contain Aboriginal objects that cannot be avoided by the activity.

A visual inspection of the project area was undertaken on 14th May 2025 by NGH archaeologist Cassandra Venn. Prior to the visual inspection NGH were notified that only two of the laydown areas in Area 12 (Lot 96 DP751745 and Lot 457 DP751745) could be accessed due to an inability to engage with the owner of the other properties. The areas that were assessed were both located on the northern side of Corbie Hill Road and can be seen in Figure 3. Survey transects were undertaken on foot and was noted that little vegetation was present which allowed for excellent visibility. All exposures were inspected for Aboriginal objects with particular attention paid to disturbed ground. The western most laydown area (Lot 96 DP751745) contained four adult horses and one foal which impeded the visual inspection. As a result only a part of the laydown area was inspected close to the road which may provide suitable room for a laydown area (Figure 4).

Lot 96 DP751745 is proposed as a laydown area in Area 12 (see Plates 1 to 4). An existing channel is located on the eastern side of the Project Area and the ground surface is lower in this section with green grass and a silty deposit. As you move further west into the laydown area the ground surface increases in elevation and natural surface gravel content. There were multiple patches of ground observed with moderately dense gravels and some larger rocks. Grass cover was minimal in these areas and the ground surface has been compacted with hoof marks visible throughout. One small grindstone was recorded in the area with similar non-cultural raw material close by (Plate 3). Overall the ground surface contained 80% exposures with 40% visibility due to gravels. No old growth native trees were observed.

The artefact recorded was a fine grained silicious grindstone with the following dimensions: 130mm (L) x 120mm (W) x 40mm (T) (Plate 3).

Lot 457 DP751745 is also proposed as a laydown area on Corbie Hill Road and is a flat landform with a small dam on the eastern boundary. There was a small amount of naturally occurring stone present in localised patches but did not appear to have been used culturally (Plate 5). The stone is not of a quality that would be used for the manufacture of stone tools. There were a number of small dirt piles in the southwestern corner of the laydown area but there was no other disturbance (Plate 6). Grass cover was at a minimum with exposures at 70% and visibility at 80%. The deposit was silty sand with few gravels in addition to the rock present (Plates 7 and 8). No Aboriginal objects or old growth native trees were observed.

Site photographs below taken during field work:

Plate 7 Lot 457 DP751745 facing west.	Plate 8 Ground surface in Lot 457 DP751745.

Further Assessment

In accordance with the process outlined in the Code of Practice this assessment has found that the potential for the proposed work activities at Area 12 to disturb Aboriginal Heritage objects or sensitive landscape features is low to moderate given the elevated terrain and the land within proposed laydowns that have far less disturbances. There are no previously recorded AHIMS sites within or in close proximity to the Project Area. Although it has been shown in the region that the landform on which the Project Area is located has some potential to contain Aboriginal objects, the level of disturbance reduces the degree of potential of any in situ cultural material or deposits being present.

Only a portion of Lot 96 DP751745 was able to be assessed due to the presence of multiple horses in the paddock. Although there was an artefact recorded within the laydown area that needs to be avoided, and only a portion the laydown area was inspected, it may be possible to extend the use of the remainder of the laydown area through further assessment if the horses are moved prior to the survey.

Furthermore, the scope of the visual inspection was reduced prior to the survey, if the other laydown areas that were not surveyed are required another visual inspection will be needed.

Recommendations

The proposed work can proceed with caution with the following recommendations:

1. Unless these areas can be avoided by ground disturbing activity. The artefact recorded in Lot 96 DP751745 must be avoided. A buffer of 10m around the artefact is necessary to avoid impacts. If it cannot be avoided an Aboriginal Heritage Impact Permit (AHIP) will be required prior to works taking place in that location.
2. A site inspection should occur for any remaining laydown areas. This includes the western laydown in Lot 96 DP751745, the laydown that covers both Lot 1 DP1030164 and Lot 740 DP751745 and the laydown in Lot 5340 DP1200273 (see Figure 5).
3. Works can proceed with caution within the eastern laydown in Lot 96 DP751745 only within the areas that have been inspected and if the works can avoid the artefact recorded. (see Figure 5).
4. Works can proceed in Lot 457 DP751745 (see Figure 5).
5. All other works must be constrained to the assessed areas. Any activity proposed outside of the current assessment areas should be subject to assessment.
6. Wherever possible, all works should be confined to those areas between the road and the channel.
7. If any items suspected of being Aboriginal in origin are discovered during the work, all work in the immediate vicinity must stop. The find will need to be assessed and if found to be an Aboriginal object must be reported to Heritage NSW.

The Proponent is reminded that it is an offence under the *NSW National Parks and Wildlife Act 1974* to disturb, damage or destroy and Aboriginal object without a valid approval to do so.
